

# The package **piton**<sup>\*</sup>

F. Pantigny  
fpantigny@wanadoo.fr

July 30, 2024

## Abstract

The package **piton** provides tools to typeset computer listings, with syntactic highlighting, by using the Lua library LPEG. It requires LuaLaTeX.

## 1 Presentation

The package **piton** uses the Lua library LPEG<sup>1</sup> for parsing informatic listings and typesets them with syntactic highlighting. Since it uses the Lua of LuaLaTeX, it works with **lualatex** only (and won't work with the other engines: **latex**, **pdflatex** and **xelatex**). It does not use external program and the compilation does not require **--shell-escape**. The compilation is very fast since all the parsing is done by the library LPEG, written in C.

Here is an example of code typeset by **piton**, with the environment **{Piton}**.

```
from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
    (we have used that arctan(x) + arctan(1/x) =  $\frac{\pi}{2}$  for  $x > 0$ )2
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x***(2*k+1)
    return s
```

The main alternatives to the package **piton** are probably the packages **listings** and **minted**.

The name of this extension (**piton**) has been chosen arbitrarily by reference to the pitons used by the climbers in alpinism.

---

<sup>\*</sup>This document corresponds to the version 3.1 of **piton**, at the date of 2024/07/30.

<sup>1</sup>LPEG is a pattern-matching library for Lua, written in C, based on *parsing expression grammars*: <http://www.inf.puc-rio.br/~roberto/lpeg/>

<sup>2</sup>This LaTeX escape has been done by beginning the comment by **#>**.

## 2 Installation

The package `piton` is contained in two files: `piton.sty` and `piton.lua` (the LaTeX file `piton.sty` loaded by `\usepackage` will load the Lua file `piton.lua`). Both files must be in a repertory where LaTeX will be able to find them, for instance in a `texmf` tree. However, the best is to install `piton` with a TeX distribution such as MiKTeX, TeX Live or MacTeX.

## 3 Use of the package

The package `piton` must be used with LuaLaTeX exclusively: if another LaTeX engine (`latex`, `pdflatex`, `xelatex`,...) is used, a fatal error will be raised.

### 3.1 Loading the package

The package `piton` should be loaded by: `\usepackage{piton}`.

If, at the end of the preamble, the package `xcolor` has not been loaded (by the final user or by another package), `piton` loads `xcolor` with the instruction `\usepackage{xcolor}` (that is to say without any option). The package `piton` doesn't load any other package. It does not any exterior program.

### 3.2 Choice of the computer language

The package `piton` supports two kinds of languages:

- the languages natively supported by `piton`, which are Python, OCaml, C (in fact C++), SQL and a language called `minimal`<sup>3</sup>;
- the languages defined by the final user by using the built-in command `\NewPitonLanguage` described p. 9 (the parsers of those languages can't be as precise as those of the native languages supported by `piton`).

By default, the language used is Python.

It's possible to change the current language with the command `\PitonOptions` and its key `language`: `\PitonOptions{language = OCaml}`.

In fact, for `piton`, the names of the informatic languages are always **case-insensitive**. In this example, we might have written `Ocaml` or `ocaml`.

For the developers, let's say that the name of the current language is stored (in lower case) in the L3 public variable `\l_piton_language_str`.

In what follows, we will speak of Python, but the features described also apply to the other languages.

### 3.3 The tools provided to the user

The package `piton` provides several tools to typeset Python codes: the command `\piton`, the environment `{Piton}` and the command `\PitonInputFile`.

- The command `\piton` should be used to typeset small pieces of code inside a paragraph. For example:

```
\piton{def square(x): return x*x}    def square(x): return x*x
```

The syntax and particularities of the command `\piton` are detailed below.

- The environment `{Piton}` should be used to typeset multi-lines code. Since it takes its argument in a verbatim mode, it can't be used within the argument of a LaTeX command. For sake of customization, it's possible to define new environments similar to the environment `{Piton}` with the command `\NewPitonEnvironment`: cf. 4.3 p. 8.

---

<sup>3</sup>That language `minimal` may be used to format pseudo-codes: cf. p. 29

- The command `\PitonInputFile` is used to insert and typeset a external file.

It's possible to insert only a part of the file: cf. part 6.2, p. 12.

The key `path` of the command `\PitonOptions` specifies a *list* of paths where the files included by `\PitonInputFile` will be searched. That list is comma separated.

The extension `piton` also provides the commands `\PitonInputFileT`, `\PitonInputFileF` and `\PitonInputFileTF` with supplementary arguments corresponding to the letters T and F. Those arguments will be executed if the file to include has been found (letter T) or not found (letter F).

### 3.4 The syntax of the command `\piton`

In fact, the command `\piton` is provided with a double syntax. It may be used as a standard command of LaTeX taking its argument between curly braces (`\piton{...}`) but it may also be used with a syntax similar to the syntax of the command `\verb`, that is to say with the argument delimited by two identical characters (e.g.: `\piton|...|`).

- **Syntax `\piton{...}`**

When its argument is given between curly braces, the command `\piton` does not take its argument in verbatim mode. In particular:

- several consecutive spaces will be replaced by only one space (and the also the character of end on line),  
but the command `\_` is provided to force the insertion of a space;
- it's not possible to use `%` inside the argument,  
but the command `\%` is provided to insert a `%`;
- the braces must be appear by pairs correctly nested  
but the commands `\{` and `\}` are also provided for individual braces;
- the LaTeX commands<sup>4</sup> are fully expanded and not executed,  
so it's possible to use `\\"` to insert a backslash.

The other characters (including `#`, `^`, `_`, `&`, `$` and `@`) must be inserted without backslash.

Examples :

```
\piton{MyString = '\\n'}
\piton{def even(n): return n%2==0}
\piton{c="#"      # an affectation }
\piton{c="#" \ \ \ # an affectation }
\piton{MyDict = {'a': 3, 'b': 4 }}
```

```
MyString = '\n'
def even(n): return n%2==0
c="#"      # an affectation
c="#"      # an affectation
MyDict = {'a': 3, 'b': 4 }
```

It's possible to use the command `\piton` in the arguments of a LaTeX command.<sup>5</sup>

- **Syntax `\piton|...|`**

When the argument of the command `\piton` is provided between two identical characters, that argument is taken in a *verbatim mode*. Therefore, with that syntax, the command `\piton` can't be used within the argument of another command.

Examples :

```
\piton|MyString = '\n'|
\piton!def even(n): return n%2==0!
\piton+c="#"      # an affectation +
\piton?MyDict = {'a': 3, 'b': 4}?
```

```
MyString = '\n'
def even(n): return n%2==0
c="#"      # an affectation
MyDict = {'a': 3, 'b': 4}
```

---

<sup>4</sup>That concerns the commands beginning with a backslash but also the active characters (with catcode equal to 13).

<sup>5</sup>For example, it's possible to use the command `\piton` in a footnote. Example : `s = 'A string'`.

## 4 Customization

With regard to the font used by `piton` in its listings, it's only the current monospaced font. The package `piton` merely uses internally the standard LaTeX command `\texttt{}`.

### 4.1 The keys of the command `\PitonOptions`

The command `\PitonOptions` takes in as argument a comma-separated list of `key=value` pairs. The scope of the settings done by that command is the current TeX group.<sup>6</sup>

These keys may also be applied to an individual environment `{Piton}` (between square brackets).

- The key `language` specifies which computer language is considered (that key is case-insensitive). Five values are allowed : Python, OCaml, C, SQL and minimal. The initial value is Python.
- The key `path` specifies a path where the files included by `\PitonInputFile` will be searched.
- The key `gobble` takes in as value a positive integer  $n$ : the first  $n$  characters are discarded (before the process of highlighting of the code) for each line of the environment `{Piton}`. These characters are not necessarily spaces.
- When the key `auto-gobble` is in force, the extension `piton` computes the minimal value  $n$  of the number of consecutive spaces beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of  $n$ .
- When the key `env-gobble` is in force, `piton` analyzes the last line of the environment `{Piton}`, that is to say the line which contains `\end{Piton}` and determines whether that line contains only spaces followed by the `\end{Piton}`. If we are in that situation, `piton` computes the number  $n$  of spaces on that line and applies `gobble` with that value of  $n$ . The name of that key comes from *environment gobble*: the effect of `gobble` is set by the position of the commands `\begin{Piton}` and `\end{Piton}` which delimit the current environment.
- The key `write` takes in as argument a name of file (with its extension) and write the content<sup>7</sup> of the current environment in that file. At the first use of a file by `piton`, it is erased.
- The key `path-write` specifies a path where the files written by the key `write` will be written.
- The key `line-numbers` activates the line numbering in the environments `{Piton}` and in the listings resulting from the use of `\PitonInputFile`.

In fact, the key `line-numbers` has several subkeys.

- With the key `line-numbers/skip-empty-lines`, the empty lines (which contains only spaces) are considered as non existent for the line numbering (if the key `/absolute`, described below, is in force, the key `/skip-empty-lines` is no-op in `\PitonInputFile`). The initial value of that key is `true` (and not `false`).<sup>8</sup>
- With the key `line-numbers/label-empty-lines`, the labels (that is to say the numbers) of the empty lines are displayed. If the key `/skip-empty-line` is in force, the clé `/label-empty-lines` is no-op. The initial value of that key is `true`.<sup>9</sup>
- With the key `line-numbers/absolute`, in the listings generated in `\PitonInputFile`, the numbers of the lines displayed are *absolute* (that is to say: they are the numbers of the lines in the file). That key may be useful when `\PitonInputFile` is used to insert only a part of the file (cf. part 6.2, p. 12). The key `/absolute` is no-op in the environments `{Piton}` and those created by `\NewPitonEnvironment`.
- The key `line-numbers/start` requires that the line numbering begins to the value of the key.

<sup>6</sup>We remind that a LaTeX environment is, in particular, a TeX group.

<sup>7</sup>In fact, it's not exactly the body of the environment but the value of `piton.get_last_code()` which is the body without the overwritten LaTeX formatting instructions (cf. the part 7, p. 20).

<sup>8</sup>For the language Python, the empty lines in the docstrings are taken into account (by design).

<sup>9</sup>When the key `split-on-empty-lines` is in force, the labels of the empty are never printed.

- With the key `line-numbers/resume`, the counter of lines is not set to zero at the beginning of each environment `{Piton}` or use of `\PitonInputFile` as it is otherwise. That allows a numbering of the lines across several environments.
- The key `line-numbers/sep` is the horizontal distance between the numbers of lines (inserted by `line-numbers`) and the beginning of the lines of code. The initial value is 0.7 em.
- **New 3.1** The key `line-numbers/format` is a list of tokens which are inserted before the number of line in order to format it. The initial value is `\footnotesize\color{gray}`.

For convenience, a mechanism of factorisation of the prefix `line-numbers` is provided. That means that it is possible, for instance, to write:

```
\PitonOptions
{
    line-numbers =
    {
        skip-empty-lines = false ,
        label-empty-lines = false ,
        sep = 1 em
    }
}
```

- The key `left-margin` corresponds to a margin on the left. That key may be useful in conjunction with the key `line-numbers` if one does not want the numbers in an overlapping position on the left.

It's possible to use the key `left-margin` with the value `auto`. With that value, if the key `line-numbers` is in force, a margin will be automatically inserted to fit the numbers of lines. See an example part 8.1 on page 21.

- The key `background-color` sets the background color of the environments `{Piton}` and the listings produced by `\PitonInputFile` (it's possible to fix the width of that background with the key `width` described below).

The key `background-color` supports also as value a *list* of colors. In this case, the successive rows are colored by using the colors of the list in a cyclic way.

*Example :* `\PitonOptions{background-color = {gray!5,white}}`

The key `background-color` accepts a color defined «on the fly». For example, it's possible to write `background-color = [cmyk]{0.1,0.05,0,0}`.

- With the key `prompt-background-color`, piton adds a color background to the lines beginning with the prompt “`>>>`” (and its continuation “`...`”) characteristic of the Python consoles with REPL (*read-eval-print loop*).
- The key `width` will fix the width of the listing. That width applies to the colored backgrounds specified by `background-color` and `prompt-background-color` but also for the automatic breaking of the lines (when required by `break-lines`: cf. 6.1.2, p. 11).

That key may take in as value a numeric value but also the special value `min`. With that value, the width will be computed from the maximal width of the lines of code. Caution: the special value `min` requires two compilations with LuaLaTeX<sup>10</sup>.

For an example of use of `width=min`, see the section 8.2, p. 21.

- When the key `show-spaces-in-strings` is activated, the spaces in the strings of characters<sup>11</sup> are replaced by the character `□` (U+2423 : OPEN BOX). Of course, that character U+2423 must

---

<sup>10</sup>The maximal width is computed during the first compilation, written on the `aux` file and re-used during the second compilation. Several tools such as `latexm` (used by Overleaf) do automatically a sufficient number of compilations.

<sup>11</sup>With the language Python that feature applies only to the short strings (delimited by ' or "). In OCaml, that feature does not apply to the *quoted strings*.

be present in the monospaced font which is used.<sup>12</sup>

Example : `my_string = 'Very\u00e9good\u00e9answer'`

With the key `show-spaces`, all the spaces are replaced by U+2423 (and no line break can occur on those “visible spaces”, even when the key `break-lines`<sup>13</sup> is in force). By the way, one should remark that all the trailing spaces (at the end of a line) are deleted by `piton`. The tabulations at the beginning of the lines are represented by arrows.

```
\begin{Piton}[language=C,language=C,auto-gobble,background-color = gray!15]
void bubbleSort(int arr[], int n) {
    int temp;
    int swapped;
    for (int i = 0; i < n-1; i++) {
        swapped = 0;
        for (int j = 0; j < n - i - 1; j++) {
            if (arr[j] > arr[j + 1]) {
                temp = arr[j];
                arr[j] = arr[j + 1];
                arr[j + 1] = temp;
                swapped = 1;
            }
        }
        if (!swapped) break;
    }
}
\end{Piton}

1 void bubbleSort(int arr[], int n) {
2     int temp;
3     int swapped;
4     for (int i = 0; i < n-1; i++) {
5         swapped = 0;
6         for (int j = 0; j < n - i - 1; j++) {
7             if (arr[j] > arr[j + 1]) {
8                 temp = arr[j];
9                 arr[j] = arr[j + 1];
10                arr[j + 1] = temp;
11                swapped = 1;
12            }
13        }
14        if (!swapped) break;
15    }
16 }
```

The command `\PitonOptions` provides in fact several other keys which will be described further (see in particular the “Pages breaks and line breaks” p. 10).

## 4.2 The styles

### 4.2.1 Notion of style

The package `piton` provides the command `\SetPitonStyle` to customize the different styles used to format the syntactic elements of the Python listings. The customizations done by that command are limited to the current TeX group.<sup>14</sup>

<sup>12</sup>The package `piton` simply uses the current monospaced font. The best way to change that font is to use the command `\setmonofont` of the package `fontspec`.

<sup>13</sup>cf. 6.1.2 p. 11

<sup>14</sup>We remind that a LaTeX environment is, in particular, a TeX group.

The command `\SetPitonStyle` takes in as argument a comma-separated list of `key=value` pairs. The keys are names of styles and the value are LaTeX formatting instructions.

These LaTeX instructions must be formatting instructions such as `\color{...}`, `\bfseries`, `\slshape`, etc. (the commands of this kind are sometimes called *semi-global* commands). It's also possible to put, *at the end of the list of instructions*, a LaTeX command taking exactly one argument.

Here an example which changes the style used to highlight, in the definition of a Python function, the name of the function which is defined. That code uses the command `\highLight` of `luatex` (that package requires also the package `luacolor`).

```
\SetPitonStyle{ Name.Function = \bfseries \highLight[red!50] }
```

In that example, `\highLight[red!50]` must be considered as the name of a LaTeX command which takes in exactly one argument, since, usually, it is used with `\highLight[red!50]{...}`.

With that setting, we will have : `def cube(x) : return x * x * x`

The different styles, and their use by piton in the different languages which it supports (Python, OCaml, C, SQL and “minimal”), are described in the part 9, starting at the page 25.

The command `\PitonStyle` takes in as argument the name of a style and allows to retrieve the value (as a list of LaTeX instructions) of that style.

For example, it's possible to write `{\PitonStyle{Keyword}{function}}` and we will have the word `function` formatted as a keyword.

The syntax `{\PitonStyle{style}{...}}` is mandatory in order to be able to deal both with the semi-global commands and the commands with arguments which may be present in the definition of the style `style`.

#### 4.2.2 Global styles and local styles

A style may be defined globally with the command `\SetPitonStyle`. That means that it will apply to all the informatic languages that use that style.

For example, with the command

```
\SetPitonStyle{Comment = \color{gray}}
```

all the comments will be composed in gray in all the listings, whatever informatic language they use (Python, C, OCaml, etc. or a language defined by the command `\NewPitonLanguage`).

But it's also possible to define a style locally for a given informatic language by providing the name of that language as optional argument (between square brackets) to the command `\SetPitonStyle`.<sup>15</sup>

For example, with the command

```
\SetPitonStyle[SQL]{Keywords = \color[HTML]{006699} \bfseries \MakeUppercase}
```

the keywords in the SQL listings will be composed in capital letters, even if they appear in lower case in the LaTeX source (we recall that, in SQL, the keywords are case-insensitive).

As expected, if an informatic language uses a given style and if that style has no local definition for that language, the global version is used. That notion of “global style” has no link with the notion of global definition in TeX (the notion of `group` in TeX).<sup>16</sup>

The package `piton` itself (that is to say the file `piton.sty`) defines all the styles globally.

---

<sup>15</sup>We recall, that, in the package `piton`, the names of the informatic languages are case-insensitive.

<sup>16</sup>As regards the TeX groups, the definitions done by `\SetPitonStyle` are always local.

#### 4.2.3 The style UserFunction

The extension `piton` provides a special style called `UserFunction`. That style applies to the names of the functions previously defined by the user (for example, in Python, these names are those following the keyword `def` in a previous Python listing). The initial value of that style is empty, and, therefore, the names of the functions are formatted as standard text (in black). However, it's possible to change the value of that style, as any other style, with the command `\SetPitonStyle`.

In the following example, we tune the styles `Name.Function` and `UserFunction` so as to have clickable names of functions linked to the (informatic) definition of the function.

```
\NewDocumentCommand{\MyDefFunction}{m}
  {\hypertarget{piton:#1}{\color[HTML]{CC00FF}{#1}}}
\NewDocumentCommand{\MyUserFunction}{m}{\hyperlink{piton:#1}{#1}}

\SetPitonStyle{Name.Function = \MyDefFunction, UserFunction = \MyUserFunction}

def transpose(v,i,j):
    x = v[i]
    v[i] = v[j]
    v[j] = x

def passe(v):
    for i in range(0,len(v)-1):
        if v[i] > v[i+1]:
            transpose(v,i,i+1)
```

(Some PDF viewers display a frame around the clickable word `transpose` but others do not.)

Of course, the list of the names of Python functions previously defined is kept in the memory of LuaTeX (in a global way, that is to say independently of the TeX groups). The extension `piton` provides a command to clear that list : it's the command `\PitonClearUserFunctions`. When it is used without argument, that command is applied to all the informatic languages used by the user but it's also possible to use it with an optional argument (between square brackets) which is a list of informatic languages to which the command will be applied.<sup>17</sup>

### 4.3 Creation of new environments

Since the environment `{Piton}` has to catch its body in a special way (more or less as verbatim text), it's not possible to construct new environments directly over the environment `{Piton}` with the classical commands `\newenvironment` (of standard LaTeX) or `\NewDocumentEnvironment` (of LaTeX3).

That's why `piton` provides a command `\NewPitonEnvironment`. That command takes in three mandatory arguments.

That command has the same syntax as the classical environment `\NewDocumentEnvironment`.<sup>18</sup>

With the following instruction, a new environment `{Python}` will be constructed with the same behaviour as `{Piton}`:

```
\NewPitonEnvironment{Python}{\begin{tcolorbox}}{\end{tcolorbox}}
```

If one wishes to format Python code in a box of `tcolorbox`, it's possible to define an environment `{Python}` with the following code (of course, the package `tcolorbox` must be loaded).

```
\NewPitonEnvironment{Python}{}
  {\begin{tcolorbox}}
  {\end{tcolorbox}}
```

<sup>17</sup>We remind that, in `piton`, the name of the informatic languages are case-insensitive.

<sup>18</sup>However, the specifier of argument `b` (used to catch the body of the environment as a LaTeX argument) is not allowed.

With this new environment `{Python}`, it's possible to write:

```
\begin{Python}
def square(x):
    """Compute the square of a number"""
    return x*x
\end{Python}
```

```
def square(x):
    """Compute the square of a number"""
    return x*x
```

## 5 Definition of new languages with the syntax of listings

### New 3.0

The package `listings` is a famous LaTeX package to format informatic listings.

That package provides a command `\lstdefinelanguage` which allows the user to define new languages. That command is also used by `listings` itself to provide the definition of the predefined languages in `listings` (in fact, for this task, `listings` uses a command called `\lst@definelanguage` but that command has the same syntax as `\lstdefinelanguage`).

The package `piton` provides a command `\NewPitonLanguage` to define new languages (available in `\piton`, `{Piton}`, etc.) with a syntax which is almost the same as the syntax of `\lstdefinelanguage`. Let's precise that `piton` does *not* use that command to define the languages provided natively (Python, OCaml, C++, SQL and `minimal`), which allows more powerful parsers.

For example, in the file `lstlang1.sty`, which is one of the definition files of `listings`, we find the following instructions (in version 1.10a).

```
\lstdefinelanguage{Java}%
{morekeywords={abstract,boolean,break,byte,case,catch,char,class,%
  const,continue,default,do,double,else,extends,false,final,%
  finally,float,for,goto;if,implements,import,instanceof,int,%
  interface,label,long,native,new,null,package,private,protected,%
  public,return,short,static,super,switch,synchronized,this,throw,%
  throws,transient,true,try,void,volatile,while},%
  sensitive,%
  morecomment=[1]//,%
  morecomment=[s]{/*}{*/},%
  morestring=[b]",%
  morestring=[b]',%
} [keywords,comments,strings]
```

In order to define a language called `Java` for `piton`, one has only to write the following code **where the last argument of `\lst@definelanguage`, between square brackets, has been discarded** (in fact, the symbols `%` may be deleted without any problem).

```
\NewPitonLanguage{Java}%
{morekeywords={abstract,boolean,break,byte,case,catch,char,class,%
  const,continue,default,do,double,else,extends,false,final,%
  finally,float,for,goto;if,implements,import,instanceof,int,%
  interface,label,long,native,new,null,package,private,protected,%
  public,return,short,static,super,switch,synchronized,this,throw,%
  throws,transient,true,try,void,volatile,while},%
  sensitive,%
  morecomment=[1]//,%
  morecomment=[s]{/*}{*/},%
  morestring=[b]",%
  morestring=[b]',%
}
```

It's possible to use the language Java like any other language defined by piton.  
Here is an example of code formatted in an environment {Piton} with the key `language=Java`.<sup>19</sup>

```
public class Cipher { // Caesar cipher
    public static void main(String[] args) {
        String str = "The quick brown fox Jumped over the lazy Dog";
        System.out.println( Cipher.encode( str, 12 ) );
        System.out.println( Cipher.decode( Cipher.encode( str, 12 ), 12 ) );
    }

    public static String decode(String enc, int offset) {
        return encode(enc, 26-offset);
    }

    public static String encode(String enc, int offset) {
        offset = offset % 26 + 26;
        StringBuilder encoded = new StringBuilder();
        for (char i : enc.toCharArray()) {
            if (Character.isLetter(i)) {
                if (Character.isUpperCase(i)) {
                    encoded.append((char) ('A' + (i - 'A' + offset) % 26));
                } else {
                    encoded.append((char) ('a' + (i - 'a' + offset) % 26));
                }
            } else {
                encoded.append(i);
            }
        }
        return encoded.toString();
    }
}
```

The keys of the command `\lstdefinelanguage` of `listings` supported by `\NewPitonLanguage` are: `morekeywords`, `otherkeywords`, `sensitive`, `keywordsprefix`, `moretexcs`, `morestring` (with the letters `b`, `d`, `s` and `m`), `morecomment` (with the letters `i`, `l`, `s` and `n`), `moredelim` (with the letters `i`, `l`, `*` and `**`), `moredirective`, `tag`, `alsodigit`, `alsoletter` and `alsoother`.

For the description of those keys, we redirect the reader to the documentation of the package `listings` (type `texdoc listings` in a terminal).

For example, here is a language called “LaTeX” to format LaTeX chunks of codes:

```
\NewPitonLanguage{LaTeX}{keywordsprefix = \ , alsoletter = _ }
```

Initially, the characters `\` and `_` are considered as letters because, in many informatic languages, they are allowed in the keywords and the names of the identifiers. With `alsoletter = @_`, we retrieve them from the category of the letters.

## 6 Advanced features

### 6.1 Page breaks and line breaks

#### 6.1.1 Page breaks

By default, the listings produced by the environment {Piton} and the command `\PitonInputFile` are not breakable.

However, the command `\PitonOptions` provides the keys `split-on-empty-lines` and `splittable` to allow such breaks.

---

<sup>19</sup>We recall that, for piton, the names of the informatic languages are case-insensitive. Hence, it's possible to write, for instance, `language=java`.

- The key `split-on-empty-lines` allows breaks on the empty lines<sup>20</sup> in the listing. In the informatic listings, the empty lines usually separate the definitions of the informatic functions and it's pertinent to allow breaks between these functions.

In fact, when the key `split-on-empty-lines` is in force, the work goes a little further than merely allowing page breaks: several successive empty lines are deleted and replaced by the content of the parameter corresponding to the key `split-separation`. The initial value of this parameter is `\vspace{\baselineskip}\vspace{-1.25pt}` which corresponds eventually to an empty line in the final PDF (this vertical space is deleted if it occurs on a page break).

- Of course, the key `split-on-empty-lines` may not be sufficient and that's why `piton` provides the key `splittable`.

When the key `splittable` is used with the numeric value  $n$  (which must be a positive integer) the listing, or each part of the listing delimited by empty lines (when `split-on-empty-lines` is in force) may be broken anywhere with the restriction that no break will occur within the  $n$  first lines of the listing or within the  $n$  last lines. For example, a tuning with `splittable = 4` may be a good choice.

When used without value, the key `splittable` is equivalent to `splittable = 1` and the listings may be broken anywhere (it's probably not recommandable).

Even with a background color (set by the key `background-color`), the pages breaks are allowed, as soon as the key `split-on-empty-lines` or the key `splittable` is in force.<sup>21</sup>

### 6.1.2 Line breaks

By default, the elements produced by `piton` can't be broken by an end on line. However, there are keys to allow such breaks (the possible breaking points are the spaces, even the spaces in the Python strings).

- With the key `break-lines-in-piton`, the line breaks are allowed in the command `\piton{...}` (but not in the command `\piton|...|`, that is to say the command `\piton` in verbatim mode).
- With the key `break-lines-in-Piton`, the line breaks are allowed in the environment `{Piton}` (hence the capital letter P in the name) and in the listings produced by `\PitonInputFile`.
- The key `break-lines` is a conjunction of the two previous keys.

The package `piton` provides also several keys to control the appearance on the line breaks allowed by `break-lines-in-Piton`.

- With the key `indent-broken-lines`, the indentation of a broken line is respected at carriage return.
- The key `end-of-broken-line` corresponds to the symbol placed at the end of a broken line. The initial value is: `\hspace*{0.5em}\textbackslash`.
- The key `continuation-symbol` corresponds to the symbol placed at each carriage return. The initial value is: `+\\;` (the command `\\;` inserts a small horizontal space).
- The key `continuation-symbol-on-indentation` corresponds to the symbol placed at each carriage return, on the position of the indentation (only when the key `indent-broken-line` is in force). The initial value is: `$\\hookrightarrow\\;$`.

The following code has been composed with the following tuning:

---

<sup>20</sup>The “empty lines” are the lines which contains only spaces.

<sup>21</sup>With the key `splittable`, the environments `{Piton}` are breakable, even within a (breakable) environment of `tcolorbox`. Remind that an environment of `tcolorbox` included in another environment of `tcolorbox` is *not* breakable, even when both environments use the key `breakable` of `tcolorbox`.

```
\PitonOptions{width=12cm,break-lines,indent-broken-lines,background-color=gray!15}

def dict_of_list(l):
    """Converts a list of subrs and descriptions of glyphs in \
+       ↪ a dictionary"""
    our_dict = {}
    for list_letter in l:
        if (list_letter[0][0:3] == 'dup'): # if it's a subr
            name = list_letter[0][4:-3]
            print("We treat the subr of number " + name)
        else:
            name = list_letter[0][1:-3] # if it's a glyph
            print("We treat the glyph of number " + name)
        our_dict[name] = [treat_Postscript_line(k) for k in \
+           ↪ list_letter[1:-1]]
    return dict
```

## 6.2 Insertion of a part of a file

The command `\PitonInputFile` inserts (with formatting) the content of a file. In fact, it's possible to insert only *a part* of that file. Two mechanisms are provided in this aim.

- It's possible to specify the part that we want to insert by the numbers of the lines (in the original file).
- It's also possible to specify the part to insert with textual markers.

In both cases, if we want to number the lines with the numbers of the lines in the file, we have to use the key `line-numbers/absolute`.

### 6.2.1 With line numbers

The command `\PitonInputFile` supports the keys `first-line` and `last-line` in order to insert only the part of file between the corresponding lines. Not to be confused with the key `line-numbers/start` which fixes the first line number for the line numbering. In a sens, `line-numbers/start` deals with the output whereas `first-line` and `last-line` deal with the input.

### 6.2.2 With textual markers

In order to use that feature, we first have to specify the format of the markers (for the beginning and the end of the part to include) with the keys `marker-beginning` and `marker-end` (usually with the command `\PitonOptions`).

Let us take a practical example.

We assume that the file to include contains solutions to exercises of programmation on the following model.

```
#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>
```

The markers of the beginning and the end are the strings `#[Exercise 1]` and `#<Exercise 1>`. The string “Exercise 1” will be called the *label* of the exercise (or of the part of the file to be included). In order to specify such markers in piton, we will use the keys `marker/beginning` and `marker/end` with the following instruction (the character `#` of the comments of Python must be inserted with the protected form `\#`).

```
\PitonOptions{ marker/beginning = \#[#1] , marker/end = \#<#1> }
```

As one can see, `marker/beginning` is an expression corresponding to the mathematical function which transforms the label (here `Exercise 1`) into the the beginning marker (in the example `#[Exercise 1]`). The string `#1` corresponds to the occurrences of the argument of that function, which the classical syntax in TeX. Idem for `marker/end`.

Now, you only have to use the key `range` of `\PitonInputFile` to insert a marked content of the file.

```
\PitonInputFile[range = Exercise 1]{file_name}
```

```
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
```

The key `marker/include-lines` requires the insertion of the lines containing the markers.

```
\PitonInputFile[marker/include-lines,range = Exercise 1]{file_name}

#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>
```

In fact, there exist also the keys `begin-range` and `end-range` to insert several marked contents at the same time.

For example, in order to insert the solutions of the exercises 3 to 5, we will write (if the file has the correct structure!):

```
\PitonInputFile[begin-range = Exercise 3, end-range = Exercise 5]{file_name}
```

### 6.3 Highlighting some identifiers

The command `\SetPitonIdentifier` allows to change the formatting of some identifiers.

That command takes in three arguments:

- The optional argument (within square brackets) specifies the informatic language. If this argument is not present, the tunings done by `\SetPitonIdentifier` will apply to all the informatic languages of `piton`.<sup>22</sup>
- The first mandatory argument is a comma-separated list of names of identifiers.
- The second mandatory argument is a list of LaTeX instructions of the same type as `piton` “styles” previously presented (cf 4.2 p. 6).

*Caution:* Only the identifiers may be concerned by that key. The keywords and the built-in functions won’t be affected, even if their name appear in the first argument of the command `\SetPitonIdentifier`.

```
\SetPitonIdentifier{l1,l2}{\color{red}}
\begin{Piton}
def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)
\end{Piton}

def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)
```

By using the command `\SetPitonIdentifier`, it’s possible to add other built-in functions (or other new keywords, etc.) that will be detected by `piton`.

```
\SetPitonIdentifier[Python]
{cos, sin, tan, floor, ceil, trunc, pow, exp, ln, factorial}
{\PitonStyle{Name.Builtin}>

\begin{Piton}
from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
\end{Piton}
```

---

<sup>22</sup>We recall, that, in the package `piton`, the names of the informatic languages are case-insensitive.

```
from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
```

## 6.4 Mechanisms to escape to LaTeX

The package `piton` provides several mechanisms for escaping to LaTeX:

- It's possible to compose comments entirely in LaTeX.
- It's possible to have the elements between \$ in the comments composed in LaTeX mathematical mode.
- It's possible to ask `piton` to detect automatically some LaTeX commands, thanks to the key `detected-commands`.
- It's also possible to insert LaTeX code almost everywhere in a Python listing.

One should also remark that, when the extension `piton` is used with the class `beamer`, `piton` detects in `\{Piton\}` many commands and environments of Beamer: cf. 6.5 p. 18.

### 6.4.1 The “LaTeX comments”

In this document, we call “LaTeX comments” the comments which begins by `#>`. The code following those characters, until the end of the line, will be composed as standard LaTeX code. There is two tools to customize those comments.

- It's possible to change the syntactic mark (which, by default, is `#>`). For this purpose, there is a key `comment-latex` available only in the preamble of the document, allows to choice the characters which, preceded by `#`, will be the syntactic marker.

For example, if the preamble contains the following instruction:

```
\PitonOptions{comment-latex = LaTeX}
```

the LaTeX comments will begin by `#LaTeX`.

If the key `comment-latex` is used with the empty value, all the Python comments (which begins by `#`) will, in fact, be “LaTeX comments”.

- It's possible to change the formatting of the LaTeX comment itself by changing the `piton` style `Comment.LaTeX`.

For example, with `\SetPitonStyle{Comment.LaTeX = \normalfont\color{blue}}`, the LaTeX comments will be composed in blue.

If you want to have a character `#` at the beginning of the LaTeX comment in the PDF, you can use set `Comment.LaTeX` as follows:

```
\SetPitonStyle{Comment.LaTeX = \color{gray}\#\normalfont\space }
```

For other examples of customization of the LaTeX comments, see the part 8.2 p. 21

If the user has required line numbers (with the key `line-numbers`), it's possible to refer to a number of line with the command `\label` used in a LaTeX comment.<sup>23</sup>

---

<sup>23</sup>That feature is implemented by using a redefinition of the standard command `\label` in the environments `\{Piton\}`. Therefore, incompatibilities may occur with extensions which redefine (globally) that command `\label` (for example: `varioref`, `refcheck`, `showlabels`, etc.)

#### 6.4.2 The key “math-comments”

It's possible to request that, in the standard Python comments (that is to say those beginning by `#` and not `#>`), the elements between `$` be composed in LaTeX mathematical mode (the other elements of the comment being composed verbatim).

That feature is activated by the key `math-comments`, which is available only in the preamble of the document.

Here is a example, where we have assumed that the preamble of the document contains the instruction `\PitonOptions{math-comment}`:

```
\begin{Piton}
def square(x):
    return x*x # compute $x^2$
\end{Piton}

def square(x):
    return x*x # compute  $x^2$ 
```

#### 6.4.3 The key “detected-commands”

The key `detected-commands` of `\PitonOptions` allows to specify a (comma-separated) list of names of LaTeX commands that will be detected directly by `piton`.

- The key `detected-commands` must be used in the preamble of the LaTeX document.
- The names of the LaTeX commands must appear without the leading backslash (eg. `detected-commands = { emph, textbf }`).
- These commands must be LaTeX commands with only one (mandatory) argument between braces (and these braces must appear explicitly in the informatic listing).

We assume that the preamble of the LaTeX document contains the following line.

```
\PitonOptions{detected-commands = highLight}
```

Then, it's possible to write directly:

```
\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        \highLight{return n*fact(n-1)}
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

#### 6.4.4 The mechanism “escape”

It's also possible to overwrite the Python listings to insert LaTeX code almost everywhere (but between lexical units, of course). By default, `piton` does not fix any delimiters for that kind of escape. In order to use this mechanism, it's necessary to specify the delimiters which will delimit the escape (one for the beginning and one for the end) by using the keys `begin-escape` and `end-escape`, available only in the preamble of the document.

We consider once again the previous example of a recursive programmation of the factorial. We want to highlight in pink the instruction containing the recursive call. With the package `luatex`, we can use the syntax `\highLight[LightPink]{...}`. Because of the optional argument between square

brackets, it's not possible to use the key `detected-commands` but it's possible to achieve our goal with the more general mechanism “escape”.

We assume that the preamble of the document contains the following instruction:

```
\PitonOptions{begin-escape=!, end-escape=!}
```

Then, it's possible to write:

```
\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        !\highLight[LightPink]{!return n*fact(n-1)!}!
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

*Caution :* The escape to LaTeX allowed by the `begin-escape` and `end-escape` is not active in the strings nor in the Python comments (however, it's possible to have a whole Python comment composed in LaTeX by beginning it with #>; such comments are merely called “LaTeX comments” in this document).

#### 6.4.5 The mechanism “escape-math”

The mechanism “`escape-math`” is very similar to the mechanism “`escape`” since the only difference is that the elements sent to LaTeX are composed in the math mode of LaTeX.

This mechanism is activated with the keys `begin-escape-math` and `end-escape-math` (*which are available only in the preamble of the document*).

Despite the technical similarity, the use of the the mechanism “`escape-math`” is in fact rather different from that of the mechanism “`escape`”. Indeed, since the elements are composed in a mathematical mode of LaTeX, they are, in particular, composed within a TeX group and therefore, they can't be used to change the formatting of other lexical units.

In the languages where the character \$ does not play a important role, it's possible to activate that mechanism “`escape-math`” with the character \$:

```
\PitonOptions{begin-escape-math=$,end-escape-math=$}
```

Remark that the character \$ must *not* be protected by a backslash.

However, it's probably more prudent to use \(` et \)`.

```
\PitonOptions{begin-escape-math=\(,end-escape-math=\)}
```

Here is an example of utilisation.

```
\begin{Piton}[line-numbers]
def arctan(x,n=10):
    if \(x < 0\) :
        return \( -\arctan(-x) \)
    elif \(x > 1\) :
        return \( (\pi/2 - \arctan(1/x)) \)
    else:
        s = \(0\)
        for \(k\) in range(\(n\)): s += \( \smash{\frac{(-1)^k}{2k+1}} x^{2k+1} \)
        return s
\end{Piton}
```

```

1 def arctan(x,n=10):
2     if x < 0 :
3         return - arctan(-x)
4     elif x > 1 :
5         return π/2 - arctan(1/x)
6     else:
7         s = 0
8         for k in range(n): s += (-1)k / (2k+1) * x2k+1
9     return s

```

## 6.5 Behaviour in the class Beamer

### *First remark*

Since the environment `{Piton}` catches its body with a verbatim mode, it's necessary to use the environments `{Piton}` within environments `{frame}` of Beamer protected by the key `fragile`, i.e. beginning with `\begin{frame}[fragile]`.<sup>24</sup>

When the package `piton` is used within the class `beamer`<sup>25</sup>, the behaviour of `piton` is slightly modified, as described now.

### 6.5.1 `{Piton}` et `\PitonInputFile` are “overlay-aware”

When `piton` is used in the class `beamer`, the environment `{Piton}` and the command `\PitonInputFile` accept the optional argument `<...>` of Beamer for the overlays which are involved.

For example, it's possible to write:

```
\begin{Piton}<2-5>
...
\end{Piton}
```

and

```
\PitonInputFile<2-5>{my_file.py}
```

### 6.5.2 Commands of Beamer allowed in `{Piton}` and `\PitonInputFile`

When `piton` is used in the class `beamer`, the following commands of `beamer` (classified upon their number of arguments) are automatically detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`):

- no mandatory argument : `\pause`<sup>26</sup> . ;
  - one mandatory argument : `\action`, `\alert`, `\invisible`, `\only`, `\uncover` and `\visible` ;
- New 3.1**  
It's possible to add new commands to that list with the key `detected-beamer-commands` (the names of the commands must *not* be preceded by a backslash).
- two mandatory arguments : `\alt` ;
  - three mandatory arguments : `\temporal`.

---

<sup>24</sup>Remind that for an environment `{frame}` of Beamer using the key `fragile`, the instruction `\end{frame}` must be alone on a single line (except for any leading whitespace).

<sup>25</sup>The extension `piton` detects the class `beamer` and the package `beameralternative` if it is loaded previously but, if needed, it's also possible to activate that mechanism with the key `beamer` provided by `piton` at load-time: `\usepackage[beamer]{piton}`

<sup>26</sup>One should remark that it's also possible to use the command `\pause` in a “LaTeX comment”, that is to say by writing `#> \pause`. By this way, if the Python code is copied, it's still executable by Python

These commands must be used preceded and following by a space. In the mandatory arguments of these commands, the braces must be balanced. However, the braces included in short strings<sup>27</sup> of Python are not considered.

Regarding the functions `\alt` and `\temporal` there should be no carriage returns in the mandatory arguments of these functions.

Here is a complete example of file:

```
\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def string_of_list(l):
    """Convert a list of numbers in string"""
    \only<2->{s = "{" + str(l[0])}
    \only<3->{for x in l[1:]: s = s + "," + str(x)}
    \only<4->{s = s + "}"}
    return s
\end{Piton}
\end{frame}
\end{document}
```

In the previous example, the braces in the Python strings "`{`" and "`}`" are correctly interpreted (without any escape character).

### 6.5.3 Environments of Beamer allowed in {Piton} and \PitonInputFile

When `piton` is used in the class `beamer`, the following environments of Beamer are directly detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`): `{actionenv}`, `{alertenv}`, `{invisibleenv}`, `{onlyenv}`, `{uncoverenv}` and `{visibleenv}`.

#### New 3.1

It's possible to add new environments to that list with the key `detected-beamer-environments`.

However, there is a restriction: these environments must contain only *whole lines of Python code* in their body. The instructions `\begin{...}` and `\end{...}` must be alone on their lines.

Here is an example:

```
\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def square(x):
    """Compute the square of its argument"""
    \begin{uncoverenv}<2>
        return x*x
    \end{uncoverenv}
\end{Piton}
\end{frame}
\end{document}
```

#### Remark concerning the command \alert and the environment {alertenv} of Beamer

Beamer provides an easy way to change the color used by the environment `{alertenv}` (and by the command `\alert` which relies upon it) to highlight its argument. Here is an example:

---

<sup>27</sup>The short strings of Python are the strings delimited by characters '`'` or the characters "`"` and not '`'''` nor `"""`. In Python, the short strings can't extend on several lines.

```
\setbeamercolor{alerted text}{fg=blue}
```

However, when used inside an environment `{Piton}`, such tuning will probably not be the best choice because `piton` will, by design, change (most of the time) the color the different elements of text. One may prefer an environment `{alertyenv}` that will change the background color for the elements to be highlighted.

Here is a code that will do that job and add a yellow background. That code uses the command `\@highLight` of `luatex` (that extension requires also the package `luacolor`).

```
\setbeamercolor{alerted text}{bg=yellow!50}
\makeatletter
\AddToHook{env/Piton/begin}
{\renewenvironment{alertyenv}{\only#1{\@highLight[alerted text.bg]}}{}}
\makeatother
```

That code redefines locally the environment `{alertyenv}` within the environments `{Piton}` (we recall that the command `\alert` relies upon that environment `{alertyenv}`).

## 6.6 Footnotes in the environments of piton

If you want to put footnotes in an environment `{Piton}` or (or, more unlikely, in a listing produced by `\PitonInputFile`), you can use a pair `\footnotemark`–`\footnotetext`.

However, it's also possible to extract the footnotes with the help of the package `footnote` or the package `footnotehyper`.

If `piton` is loaded with the option `footnote` (with `\usepackage[footnote]{piton}` or with `\PassOptionsToPackage`), the package `footnote` is loaded (if it is not yet loaded) and it is used to extract the footnotes.

If `piton` is loaded with the option `footnotehyper`, the package `footnotehyper` is loaded (if it is not yet loaded) and it is used to extract footnotes.

Caution: The packages `footnote` and `footnotehyper` are incompatible. The package `footnotehyper` is the successor of the package `footnote` and should be used preferably. The package `footnote` has some drawbacks, in particular: it must be loaded after the package `xcolor` and it is not perfectly compatible with `hyperref`.

In this document, the package `piton` has been loaded with the option `footnotehyper`. For examples of notes, cf. [8.3](#), p. [22](#).

## 6.7 Tabulations

Even though it's recommended to indent the Python listings with spaces (see PEP 8), `piton` accepts the characters of tabulation (that is to say the characters U+0009) at the beginning of the lines. Each character U+0009 is replaced by  $n$  spaces. The initial value of  $n$  is 4 but it's possible to change it with the key `tab-size` of `\PitonOptions`.

There exists also a key `tabs-auto-gobble` which computes the minimal value  $n$  of the number of consecutive characters U+0009 beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of  $n$  (before replacement of the tabulations by spaces, of course). Hence, that key is similar to the key `auto-gobble` but acts on U+0009 instead of U+0020 (spaces). The key `env-gobble` is not compatible with the tabulations.

# 7 API for the developpers

The L3 variable `\l_piton_language_str` contains the name of the current language of `piton` (in lower case).

### New 2.6

The extension `piton` provides a Lua function `piton.get_last_code` without argument which returns the code in the latest environment of `piton`.

- The carriage returns (which are present in the initial environment) appears as characters \r (i.e. U+000D).
- The code returned by `piton.get_last_code()` takes into account the potential application of a key `gobble`, `auto-gobble` or `env-gobble` (cf. p. 4).
- The extra formatting elements added in the code are deleted in the code returned by `piton.get_last_code()`. That concerns the LaTeX commands declared by the key `detected-commands` (cf. part 6.4.3) and the elements inserted by the mechanism “`escape`” (cf. part 6.4.4).
- `piton.get_last_code` is a Lua function and not a Lua string: the treatments outlined above are executed when the function is called. Therefore, it might be judicious to store the value returned by `piton.get_last_code()` in a variable of Lua if it will be used several times.

For an example of use, see the part concerning `pyluatex`, part 8.5, p. 24.

## 8 Examples

### 8.1 Line numbering

We remind that it's possible to have an automatic numbering of the lines in the Python listings by using the key `line-numbers`.

By default, the numbers of the lines are composed by `piton` in an overlapping position on the left (by using internally the command `\llap` of LaTeX).

In order to avoid that overlapping, it's possible to use the option `left-margin=auto` which will insert automatically a margin adapted to the numbers of lines that will be written (that margin is larger when the numbers are greater than 10).

```
\PitonOptions{background-color=gray!10, left-margin = auto, line-numbers}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> (recursive call)
    elif x > 1:
        return pi/2 - arctan(1/x) #> (other recursive call)
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}

1 def arctan(x,n=10):
2     if x < 0:
3         return -arctan(-x)          (recursive call)
4     elif x > 1:
5         return pi/2 - arctan(1/x) (other recursive call)
6     else:
7         return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

### 8.2 Formatting of the LaTeX comments

It's possible to modify the style `Comment.LaTeX` (with `\SetPitonStyle`) in order to display the LaTeX comments (which begin with #>) aligned on the right margin.

```
\PitonOptions{background-color=gray!10}
\SetPitonStyle{Comment.LaTeX = \hfill \normalfont\color{gray}}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> other recursive call
```

```

    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)                                recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)                         another recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )

```

It's also possible to display these LaTeX comments in a kind of second column by limiting the width of the Python code with the key `width`. In the following example, we use the key `width` with the special value `min`. Several compilations are required.

```

\PitonOptions{background-color=gray!10, width=min}
\NewDocumentCommand{\MyLaTeXCommand}{m}{\hfill \normalfont\itshape\rlap{\quad #1}}
\SetPitonStyle{Comment.LaTeX = \MyLaTeXCommand}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x) #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)                                recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)                         another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s

```

### 8.3 Notes in the listings

In order to be able to extract the notes (which are typeset with the command `\footnote`), the extension piton must be loaded with the key `footnote` or the key `footnotehyper` as explained in the section 6.6 p. 20. In this document, the extension piton has been loaded with the key `footnotehyper`. Of course, in an environment `{Piton}`, a command `\footnote` may appear only within a LaTeX comment (which begins with `#>`). It's possible to have comments which contain only that command `\footnote`. That's the case in the following example.

```

\PitonOptions{background-color=gray!10}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)#>\footnote{First recursive call.}]
    elif x > 1:
        return pi/2 - arctan(1/x)#>\footnote{Second recursive call.}

```

```

    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)28
    elif x > 1:
        return pi/2 - arctan(1/x)29
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )

```

If an environment `{Piton}` is used in an environment `{minipage}` of LaTeX, the notes are composed, of course, at the foot of the environment `{minipage}`. Recall that such `{minipage}` can't be broken by a page break.

```

\PitonOptions{background-color=gray!10}
\emph{\begin{minipage}{\linewidth}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)#>\footnote{First recursive call.}
    elif x > 1:
        return pi/2 - arctan(1/x)#>\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )
\end{Piton}
\end{minipage}}
\def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)a
    elif x > 1:
        return pi/2 - arctan(1/x)b
    else:
        return sum( (-1)**k/(2*k+1)*x***(2*k+1) for k in range(n) )

```

---

<sup>a</sup>First recursive call.

<sup>b</sup>Second recursive call.

## 8.4 An example of tuning of the styles

The graphical styles have been presented in the section 4.2, p. 6.

We present now an example of tuning of these styles adapted to the documents in black and white.

We use the font *DejaVu Sans Mono*<sup>30</sup> specified by the command `\setmonofont` of `fontspec`.

That tuning uses the command `\highLight` of `luatex` (that package requires itself the package `luacolor`).

```

\setmonofont[Scale=0.85]{DejaVu Sans Mono}

\SetPitonStyle
{
    Number = ,
    String = \itshape ,
    String.Doc = \color{gray} \slshape ,

```

---

<sup>28</sup>First recursive call.

<sup>29</sup>Second recursive call.

<sup>30</sup>See: <https://dejavu-fonts.github.io>

```

Operator = ,
Operator.Word = \bfseries ,
Name.Builtin = ,
Name.Function = \bfseries \highLight[gray!20] ,
Comment = \color{gray} ,
Comment.LaTeX = \normalfont \color{gray},
Keyword = \bfseries ,
Name.Namespace = ,
Name.Class = ,
Name.Type = ,
InitialValues = \color{gray}
}

```

In that tuning, many values given to the keys are empty: that means that the corresponding style won't insert any formatting instruction (the element will be composed in the standard color, usually in black, etc.). Nevertheless, those entries are mandatory because the initial value of those keys in piton is *not* empty.

```

from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
        (we have used that arctan(x) + arctan(1/x) = π/2 for x > 0)
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s

```

## 8.5 Use with pyluatex

The package `pylumatex` is an extension which allows the execution of some Python code from `lualatex` (provided that Python is installed on the machine and that the compilation is done with `lualatex` and `--shell-escape`).

Here is, for example, an environment `{PitonExecute}` which formats a Python listing (with `piton`) but also displays the output of the execution of the code with Python.

```
\NewPitonEnvironment{PitonExecute}{!0{}}
{\PitonOptions{#1}}
{\begin{center}
\directlua{pylumatex.execute(piton.get_last_code(), false, true, false, true)}%
\end{center}}
\ignorespacesafterend
```

We have used the Lua function `piton.get_last_code` provided in the API of `piton` : cf. part 7, p. 20.

This environment `{PitonExecute}` takes in as optional argument (between square brackets) the options of the command `\PitonOptions`.

## 9 The styles for the different computer languages

### 9.1 The language Python

In `piton`, the default language is Python. If necessary, it's possible to come back to the language Python with `\PitonOptions{language=Python}`.

The initial settings done by `piton` in `piton.sty` are inspired by the style `manni` de Pygments, as applied by Pygments to the language Python.<sup>31</sup>

Style	Use
<code>Number</code>	the numbers
<code>String.Short</code>	the short strings (entre ' ou ")
<code>String.Long</code>	the long strings (entre ''' ou """)) excepted the doc-strings (governed by <code>String.Doc</code> )
<code>String</code>	that key fixes both <code>String.Short</code> et <code>String.Long</code>
<code>String.Doc</code>	the doc-strings (only with """ following PEP 257)
<code>String.Interpol</code>	the syntactic elements of the fields of the f-strings (that is to say the characters { et }); that style inherits for the styles <code>String.Short</code> and <code>String.Long</code> (according the kind of string where the interpolation appears)
<code>Interpol.Inside</code>	the content of the interpolations in the f-strings (that is to say the elements between { and }); if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
<code>Operator</code>	the following operators: != == << >> - ~ + / * % = < > & .   @
<code>Operator.Word</code>	the following operators: <code>in</code> , <code>is</code> , <code>and</code> , <code>or</code> et <code>not</code>
<code>Name.Builtin</code>	almost all the functions predefined by Python
<code>Name.Decorator</code>	the decorators (instructions beginning by @)
<code>Name.Namespace</code>	the name of the modules
<code>Name.Class</code>	the name of the Python classes defined by the user <i>at their point of definition</i> (with the keyword <code>class</code> )
<code>Name.Function</code>	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword <code>def</code> )
<code>UserFunction</code>	the name of the Python functions previously defined by the user (the initial value of that parameter is empty and, hence, these elements are drawn, by default, in the current color, usually black)
<code>Exception</code>	les exceptions pré définies (ex.: <code>SyntaxError</code> )
<code>InitialValues</code>	the initial values (and the preceding symbol =) of the optional arguments in the definitions of functions; if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
<code>Comment</code>	the comments beginning with #
<code>Comment.LaTeX</code>	the comments beginning with #>, which are composed by <code>piton</code> as LaTeX code (merely named "LaTeX comments" in this document)
<code>Keyword.Constant</code>	<code>True</code> , <code>False</code> et <code>None</code>
<code>Keyword</code>	the following keywords: <code>assert</code> , <code>break</code> , <code>case</code> , <code>continue</code> , <code>del</code> , <code>elif</code> , <code>else</code> , <code>except</code> , <code>exec</code> , <code>finally</code> , <code>for</code> , <code>from</code> , <code>global</code> , <code>if</code> , <code>import</code> , <code>lambda</code> , <code>non local</code> , <code>pass</code> , <code>raise</code> , <code>return</code> , <code>try</code> , <code>while</code> , <code>with</code> , <code>yield</code> et <code>yield from</code> .

<sup>31</sup>See: <https://pygments.org/styles/>. Remark that, by default, Pygments provides for its style `manni` a colored background whose color is the HTML color #F0F3F3. It's possible to have the same color in `{Piton}` with the instruction `\PitonOptions{background-color = [HTML]{F0F3F3}}`.

## 9.2 The language OCaml

It's possible to switch to the language OCaml with \PitonOptions{language = OCaml}.

It's also possible to set the language OCaml for an individual environment {Piton}.

```
\begin{Piton}[language=OCaml]  
...  
\end{Piton}
```

The option exists also for \PitonInputFile : \PitonInputFile[language=OCaml]{...}

Style	Use
Number	the numbers
String.Short	the characters (between ' )
String.Long	the strings, between " but also the <i>quoted-strings</i>
String	that key fixes both String.Short and String.Long
Operator	les opérateurs, en particulier +, -, /, *, @, !=, ==, &&
Operator.Word	les opérateurs suivants : and, asr, land, lor, lsl, lxor, mod et or
Name.Builtin	les fonctions not, incr, decr, fst et snd
Name.Type	the name of a type of OCaml
Name.Field	the name of a field of a module
Name.Constructor	the name of the constructors of types (which begins by a capital)
Name.Module	the name of the modules
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
UserFunction	the name of the OCaml functions previously defined by the user (the initial value of that parameter is empty and these elements are drawn in the current color, usually black)
Exception	the predefined exceptions (eg : End_of_File)
TypeParameter	the parameters of the types
Comment	the comments, between (* et *); these comments may be nested
Keyword.Constant	true et false
Keyword	the following keywords: assert, as, begin, class, constraint, done, downto, do, else, end, exception, external, for, function, functor, fun , if include, inherit, initializer, in , lazy, let, match, method, module, mutable, new, object, of, open, private, raise, rec, sig, struct, then, to, try, type, value, val, virtual, when, while and with

### 9.3 The language C (and C++)

It's possible to switch to the language C with `\PitonOptions{language = C}`.

It's also possible to set the language C for an individual environment `{Piton}`.

```
\begin{Piton}[language=C]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=C]{...}`

---

Style	Use
Number	the numbers
String.Long	the strings (between ")
String.Interpol	the elements %d, %i, %f, %c, etc. in the strings; that style inherits from the style String.Long
Operator	the following operators : != == << >> - ~ + / * % = < > & .   @
Name.Type	the following predefined types: bool, char, char16_t, char32_t, double, float, int, int8_t, int16_t, int32_t, int64_t, long, short, signed, unsigned, void et wchar_t
Name.Builtin	the following predefined functions: printf, scanf, malloc, sizeof and alignof
Name.Class	le nom des classes au moment de leur définition, c'est-à-dire après le mot-clé class
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
UserFunction	the name of the Python functions previously defined by the user (the initial value of that parameter is empty and these elements are drawn in the current color, usually black)
Preproc	the instructions of the preprocessor (beginning par #)
Comment	the comments (beginning by // or between /* and */)
Comment.LaTeX	the comments beginning by //> which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
Keyword.Constant	default, false, NULL, nullptr and true
Keyword	the following keywords: alignas, asm, auto, break, case, catch, class, constexpr, const, continue, decltype, do, else, enum, extern, for, goto, if, noexcept, private, public, register, restricted, try, return, static, static_assert, struct, switch, thread_local, throw, typedef, union, using, virtual, volatile and while

---

## 9.4 The language SQL

It's possible to switch to the language SQL with `\PitonOptions{language = SQL}`.

It's also possible to set the language SQL for an individual environment `{Piton}`.

```
\begin{Piton}[language=SQL]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=SQL]{...}`

Style	Use
<code>Number</code>	the numbers
<code>String.Long</code>	the strings (between ' and not " because the elements between " are names of fields and formatted with <code>Name.Field</code> )
<code>Operator</code>	the following operators : = != <> >= > < <= * + /
<code>Name.Table</code>	the names of the tables
<code>Name.Field</code>	the names of the fields of the tables
<code>Name.Builtin</code>	the following built-in functions (their names are <i>not</i> case-sensitive): avg, count, char_length, concat, curdate, current_date, date_format, day, lower, ltrim, max, min, month, now, rank, round, rtrim, substring, sum, upper and year.
<code>Comment</code>	the comments (beginning by -- or between /* and */)
<code>Comment.LaTeX</code>	the comments beginning by --> which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Keyword</code>	the following keywords (their names are <i>not</i> case-sensitive): add, after, all, alter, and, as, asc, between, by, change, column, create, cross join, delete, desc, distinct, drop, from, group, having, in, inner, insert, into, is, join, left, like, limit, merge, not, null, on, or, order, over, right, select, set, table, then, truncate, union, update, values, when and with.

It's possible to automatically capitalize the keywords by modifying locally for the language SQL the style `Keywords`.

```
\SetPitonStyle[SQL]{Keywords = \bfseries \MakeUppercase}
```

## 9.5 The language “minimal”

It's possible to switch to the language “minimal” with `\PitonOptions{language = minimal}`.

It's also possible to set the language “minimal” for an individual environment `{Piton}`.

```
\begin{Piton}[language=minimal]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=minimal]{...}`

Style	Usage
<code>Number</code>	the numbers
<code>String</code>	the strings (between ")
<code>Comment</code>	the comments (which begin with #)
<code>Comment.LaTeX</code>	the comments beginning with #>, which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)

That language is provided for the final user who might wish to add keywords in that language (with the command `\SetPitonIdentifier`: cf. 6.3, p. 14) in order to create, for example, a language for pseudo-code.

## 9.6 The languages defined by \NewPitonLanguage

The command `\NewPitonLanguage`, which defines new informatic languages with the syntax of the extension `listings`, has been described p. 9.

All the languages defined by the command `\NewPitonLanguage` use the same styles.

Style	Use
<code>Number</code>	the numbers
<code>String.Long</code>	the strings defined in <code>\NewPitonLanguage</code> by the key <code>morestring</code>
<code>Comment</code>	the comments defined in <code>\NewPitonLanguage</code> by the key <code>morecomment</code>
<code>Comment.LaTeX</code>	the comments which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Keyword</code>	the keywords defined in <code>\NewPitonLanguage</code> by the keys <code>morekeywords</code> and <code>moretexcs</code> (and also the key <code>sensitive</code> which specifies whether the keywords are case-sensitive or not)
<code>Directive</code>	the directives defined in <code>\NewPitonLanguage</code> by the key <code>moredirectives</code>
<code>Tag</code>	the “tags” defined by the key <code>tag</code> (the lexical units detected within the tag will also be formatted with their own style)

## 10 Implementation

The development of the extension `piton` is done on the following GitHub depot:  
<https://github.com/fpantigny/piton>

### 10.1 Introduction

The main job of the package `piton` is to take in as input a Python listing and to send back to LaTeX as output that code with *interlaced LaTeX instructions of formatting*.

In fact, all that job is done by a LPEG called `python`. That LPEG, when matched against the string of a Python listing, returns as capture a Lua table containing data to send to LaTeX. The only thing to do after will be to apply `tex.tprint` to each element of that table.<sup>32</sup>

Consider, for example, the following Python code:

```
def parity(x):
    return x%2
```

The capture returned by the `lpeg python` against that code is the Lua table containing the following elements :

```
{ "\\\_piton_begin_line:" }a
{ "{\PitonStyle{Keyword}{}}"b
{ luatexbase.catcodetables.CatcodeTableOtherc, "def" }
{ "}" }
{ luatexbase.catcodetables.CatcodeTableOther, " " }
{ "{\PitonStyle{Name.Function}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "parity" }
{ "}" }
{ luatexbase.catcodetables.CatcodeTableOther, "(" }
{ luatexbase.catcodetables.CatcodeTableOther, "x" }
{ luatexbase.catcodetables.CatcodeTableOther, ")" }
{ luatexbase.catcodetables.CatcodeTableOther, ":" }
{ "\\\_piton_end_line: \\\_piton_newline: \\\_piton_begin_line:" }
{ luatexbase.catcodetables.CatcodeTableOther, " " }
{ "{\PitonStyle{Keyword}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "return" }
{ "}" }
{ luatexbase.catcodetables.CatcodeTableOther, " " }
{ luatexbase.catcodetables.CatcodeTableOther, "x" }
{ "{\PitonStyle{Operator}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "&" }
{ "}" }
{ "{\PitonStyle{Number}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "2" }
{ "}" }
{ "\\\_piton_end_line:" }
```

---

<sup>a</sup>Each line of the Python listings will be encapsulated in a pair: `\_@@_begin_line: - \@@_end_line:`. The token `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`. Both tokens `\_@@_begin_line:` and `\@@_end_line:` will be nullified in the command `\piton` (since there can't be lines breaks in the argument of a command `\piton`).

<sup>b</sup>The lexical elements of Python for which we have a `piton` style will be formatted via the use of the command `\PitonStyle`. Such an element is typeset in LaTeX via the syntax `{\PitonStyle{style}{...}}` because the instructions inside an `\PitonStyle` may be both semi-global declarations like `\bfseries` and commands with one argument like `\fbox`.

<sup>c</sup>`luatexbase.catcodetables.CatcodeTableOther` is a mere number which corresponds to the “catcode table” whose all characters have the catcode “other” (which means that they will be typeset by LaTeX verbatim).

---

<sup>32</sup>Recall that `tex.tprint` takes in as argument a Lua table whose first component is a “catcode table” and the second element a string. The string will be sent to LaTeX with the regime of catcodes specified by the catcode table. If no catcode table is provided, the standard catcodes of LaTeX will be used.

We give now the LaTeX code which is sent back by Lua to TeX (we have written on several lines for legibility but no character \r will be sent to LaTeX). The characters which are greyed-out are sent to LaTeX with the catcode “other” (=12). All the others characters are sent with the regime of catcodes of L3 (as set by \ExplSyntaxOn)

```
\_\_piton\_begin\_line:{\PitonStyle{Keyword}{def}}
\_\_piton\_end\_line:{\PitonStyle{Name.Function}{parity}}(x):\_\_piton\_newline:
\_\_piton\_begin\_line:{\PitonStyle{Keyword}{return}}
\_\_piton\_end\_line:{\PitonStyle{Operator}{%}}{\PitonStyle{Number}{2}}\_\_piton\_newline:
```

## 10.2 The L3 part of the implementation

### 10.2.1 Declaration of the package

```
1  {*STY}
2  \NeedsTeXFormat{LaTeX2e}
3  \RequirePackage{l3keys2e}
4  \ProvidesExplPackage
5    {piton}
6  {\PitonFileVersion}
7  {\PitonFileDate}
8  {Highlight informatic listings with LPEG on LuaLaTeX}

9  \cs_new_protected:Npn \@@_error:n { \msg_error:nn { piton } }
10 \cs_new_protected:Npn \@@_warning:n { \msg_warning:nn { piton } }
11 \cs_new_protected:Npn \@@_error:nn { \msg_error:nnn { piton } }
12 \cs_new_protected:Npn \@@_error:nnn { \msg_error:nnnn { piton } }
13 \cs_new_protected:Npn \@@_fatal:n { \msg_fatal:nn { piton } }
14 \cs_new_protected:Npn \@@_fatal:nn { \msg_fatal:nnn { piton } }
15 \cs_new_protected:Npn \@@_msg_new:nn { \msg_new:nnn { piton } }
16 \cs_new_protected:Npn \@@_gredirect_none:n #1
17  {
18    \group_begin:
19    \globaldefs = 1
20    \msg_redirect_name:nnn { piton } { #1 } { none }
21    \group_end:
22 }
```

With Overleaf, by default, a document is compiled in non-stop mode. When there is an error, there is no way to the user to use the key H in order to have more information. That's why we decide to put that piece of information (for the messages with such information) in the main part of the message when the key `messages-for-Overleaf` is used (at load-time).

```
23 \cs_new_protected:Npn \@@_msg_new:nnn #1 #2 #3
24  {
25    \bool_if:NTF \g_@@_messages_for_Overleaf_bool
26      { \msg_new:nnn { piton } { #1 } { #2 \\ #3 } }
27      { \msg_new:nnnn { piton } { #1 } { #2 } { #3 } }
28 }
```

We also create a command which will generate usually an error but only a warning on Overleaf. The argument is given by currying.

```
29 \cs_new_protected:Npn \@@_error_or_warning:n
30  { \bool_if:NTF \g_@@_messages_for_Overleaf_bool \@@_warning:n \@@_error:n }
```

We try to detect whether the compilation is done on Overleaf. We use `\c_sys_jobname_str` because, with Overleaf, the value of `\c_sys_jobname_str` is always “output”.

```
31 \bool_new:N \g_@@_messages_for_Overleaf_bool
32 \bool_gset:Nn \g_@@_messages_for_Overleaf_bool
33  {
34    \str_if_eq_p:on \c_sys_jobname_str { _region_ } % for Emacs
35    || \str_if_eq_p:on \c_sys_jobname_str { output } % for Overleaf
36  }
```

```

119 }

120 \bool_if:NT \g_@@_footnote_bool
121 {
```

The class `beamer` has its own system to extract footnotes and that's why we have nothing to do if `beamer` is used.

```

122 \IfClassLoadedTF { beamer }
123 { \bool_gset_false:N \g_@@_footnote_bool }
124 {
125   \IfPackageLoadedTF { footnotehyper }
126   { \@@_error:n { footnote~with~footnotehyper~package } }
127   { \usepackage { footnote } }
128 }
129 }

130 \bool_if:NT \g_@@_footnotehyper_bool
131 {
```

The class `beamer` has its own system to extract footnotes and that's why we have nothing to do if `beamer` is used.

```

132 \IfClassLoadedTF { beamer }
133 { \bool_gset_false:N \g_@@_footnote_bool }
134 {
```

```

135     \IfPackageLoadedTF { footnote }
136     { \@@_error:n { footnotehyper~with~footnote~package } }
137     { \usepackage { footnotehyper } }
138     \bool_gset_true:N \g_@@_footnote_bool
139   }
140 }

```

The flag `\g_@@_footnote_bool` is raised and so, we will only have to test `\g_@@_footnote_bool` in order to know if we have to insert an environment `{savenotes}`.

```

141 \lua_now:n
142 {
143   piton.BeamerCommands = lpeg.P ( "\\"uncover"
144     + "\\"only" + "\\"visible" + "\\"invisible" + "\\"alert" + "\\"action"
145   piton.beamer_environments = { "uncoverenv" , "onlyenv" , "visibleenv" ,
146     "invisibleref" , "alertenv" , "actionenv" }
147   piton.DetectedCommands = lpeg.P ( false )
148   piton.last_code = ''
149   piton.last_language = ''
150 }

```

### 10.2.2 Parameters and technical definitions

The following string will contain the name of the informatic language considered (the initial value is `python`).

```

151 \str_new:N \l_piton_language_str
152 \str_set:Nn \l_piton_language_str { python }

```

Each time the command `\PitonInputFile` of `piton` is used, the code of that environment will be stored in the following global string.

```
153 \tl_new:N \g_piton_last_code_tl
```

The following parameter corresponds to the key `path` (which is the path used to include files by `\PitonInputFile`). Each component of that sequence will be a string (type `str`).

```
154 \seq_new:N \l_@@_path_seq
```

The following parameter corresponds to the key `path-write` (which is the path used when writing files from listings inserted in the environments of `piton` by use of the key `write`).

```
155 \str_new:N \l_@@_path_write_str
```

In order to have a better control over the keys.

```

156 \bool_new:N \l_@@_in_PitonOptions_bool
157 \bool_new:N \l_@@_in_PitonInputFile_bool

```

We will compute (with Lua) the numbers of lines of the Python code and store it in the following counter.

```
158 \int_new:N \l_@@_nb_lines_int
```

The same for the number of non-empty lines of the Python codes.

```
159 \int_new:N \l_@@_nb_non_empty_lines_int
```

The following counter will be used to count the lines during the composition. It will count all the lines, empty or not empty. It won't be used to print the numbers of the lines.

```
160 \int_new:N \g_@@_line_int
```

The following token list will contain the (potential) information to write on the `aux` (to be used in the next compilation).

```
161 \tl_new:N \g_@@_aux_tl
```

The following counter corresponds to the key `splittable` of `\PitonOptions`. If the value of `\l_@@_splittable_int` is equal to `n`, then no line break can occur within the first `n` lines or the last `n` lines of the listings.

```
162 \int_new:N \l_@@_splittable_int
```

When the key `split-on-empty-lines` will be in force, then the following token list will be inserted between the chunks of code (the informatic code provided by the final user is split in chunks on the empty lines in the code).

```
163 \tl_new:N \l_@@_split_separation_tl
164 \tl_set:Nn \l_@@_split_separation_tl { \vspace{\baselineskip} \vspace{-1.25pt} }
```

An initial value of `splittable` equal to 100 is equivalent to say that the environments `{Piton}` are unbreakable.

```
165 \int_set:Nn \l_@@_splittable_int { 100 }
```

The following string corresponds to the key `background-color` of `\PitonOptions`.

```
166 \clist_new:N \l_@@_bg_color_clist
```

The package `piton` will also detect the lines of code which correspond to the user input in a Python console, that is to say the lines of code beginning with `>>>` and `....`. It's possible, with the key `prompt-background-color`, to require a background for these lines of code (and the other lines of code will have the standard background color specified by `background-color`).

```
167 \tl_new:N \l_@@_prompt_bg_color_tl
```

The following parameters correspond to the keys `begin-range` and `end-range` of the command `\PitonInputFile`.

```
168 \str_new:N \l_@@_begin_range_str
169 \str_new:N \l_@@_end_range_str
```

The argument of `\PitonInputFile`.

```
170 \str_new:N \l_@@_file_name_str
```

We will count the environments `{Piton}` (and, in fact, also the commands `\PitonInputFile`, despite the name `\g_@@_env_int`).

```
171 \int_new:N \g_@@_env_int
```

The parameter `\l_@@_writer_str` corresponds to the key `write`. We will store the list of the files already used in `\g_@@_write_seq` (we must not erase a file which has been still been used).

```
172 \str_new:N \l_@@_write_str
173 \seq_new:N \g_@@_write_seq
```

The following boolean corresponds to the key `show-spaces`.

```
174 \bool_new:N \l_@@_show_spaces_bool
```

The following booleans correspond to the keys `break-lines` and `indent-broken-lines`.

```
175 \bool_new:N \l_@@_break_lines_in_Piton_bool
176 \bool_new:N \l_@@_indent_broken_lines_bool
```

The following token list corresponds to the key `continuation-symbol`.

```
177 \tl_new:N \l_@@_continuation_symbol_tl
178 \tl_set:Nn \l_@@_continuation_symbol_tl { + }
```

The following token list corresponds to the key `continuation-symbol-on-indentation`. The name has been shorten to `csoi`.

```
179 \tl_new:N \l_@@_csoi_tl
180 \tl_set:Nn \l_@@_csoi_tl { $ \hookrightarrow \; $ }
```

The following token list corresponds to the key `end-of-broken-line`.

```
181 \tl_new:N \l_@@_end_of_broken_line_tl
182 \tl_set:Nn \l_@@_end_of_broken_line_tl { \hspace*{0.5em} \textbackslash }
```

The following boolean corresponds to the key `break-lines-in-piton`.

```
183 \bool_new:N \l_@@_break_lines_in_piton_bool
```

The following dimension will be the width of the listing constructed by `{Piton}` or `\PitonInputFile`.

- If the user uses the key `width` of `\PitonOptions` with a numerical value, that value will be stored in `\l_@@_width_dim`.
- If the user uses the key `width` with the special value `min`, the dimension `\l_@@_width_dim` will, *in the second run*, be computed from the value of `\l_@@_line_width_dim` stored in the aux file (computed during the first run the maximal width of the lines of the listing). During the first run, `\l_@@_width_line_dim` will be set equal to `\linewidth`.
- Elsewhere, `\l_@@_width_dim` will be set at the beginning of the listing (in `\@@_pre_env:`) equal to the current value of `\linewidth`.

184 `\dim_new:N \l_@@_width_dim`

We will also use another dimension called `\l_@@_line_width_dim`. That will the width of the actual lines of code. That dimension may be lower than the whole `\l_@@_width_dim` because we have to take into account the value of `\l_@@_left_margin_dim` (for the numbers of lines when `line-numbers` is in force) and another small margin when a background color is used (with the key `background-color`).

185 `\dim_new:N \l_@@_line_width_dim`

The following flag will be raised with the key `width` is used with the special value `min`.

186 `\bool_new:N \l_@@_width_min_bool`

If the key `width` is used with the special value `min`, we will compute the maximal width of the lines of an environment `{Piton}` in `\g_@@_tmp_width_dim` because we need it for the case of the key `width` is used with the special value `min`. We need a global variable because, when the key `footnote` is in force, each line when be composed in an environment `{savenotes}` and we need to exit our `\g_@@_tmp_width_dim` from that environment.

187 `\dim_new:N \g_@@_tmp_width_dim`

The following dimension corresponds to the key `left-margin` of `\PitonOptions`.

188 `\dim_new:N \l_@@_left_margin_dim`

The following boolean will be set when the key `left-margin=auto` is used.

189 `\bool_new:N \l_@@_left_margin_auto_bool`

The following dimension corresponds to the key `numbers-sep` of `\PitonOptions`.

190 `\dim_new:N \l_@@_numbers_sep_dim`

191 `\dim_set:Nn \l_@@_numbers_sep_dim { 0.7 em }`

Be careful. The following sequence `\g_@@_languages_seq` is not the list of the languages supported by piton. It's the list of the languages for which at least a user function has been defined. We need that sequence only for the command `\PitonClearUserFunctions` when it is used without its optional argument: it must clear all the list of languages for which at least a user function has been defined.

192 `\seq_new:N \g_@@_languages_seq`

193 `\int_new:N \l_@@_tab_size_int`

194 `\int_set:Nn \l_@@_tab_size_int { 4 }`

195 `\cs_new_protected:Npn \@@_tab:`

196 `{`

197 `\bool_if:NTF \l_@@_show_spaces_bool`

198 `{`

199 `\hbox_set:Nn \l_tmpa_box`

200 `{ \prg_replicate:nn \l_@@_tab_size_int { ~ } }`

201 `\dim_set:Nn \l_tmpa_dim { \box_wd:N \l_tmpa_box }`

202 `\color{gray}`

203 `{ \hbox_to_wd:nn \l_tmpa_dim { \rightarrowfill } } \)`

204 `}`

205 `{ \hbox:n { \prg_replicate:nn \l_@@_tab_size_int { ~ } } }`

206 `\int_gadd:Nn \g_@@_indentation_int \l_@@_tab_size_int`

207 `}`

The following integer corresponds to the key `gobble`.

```
208 \int_new:N \l_@@_gobble_int
```

The following token list will be used only for the spaces in the strings.

```
209 \tl_new:N \l_@@_space_tl
210 \tl_set_eq:NN \l_@@_space_tl \nobreakspace
```

At each line, the following counter will count the spaces at the beginning.

```
211 \int_new:N \g_@@_indentation_int
```

```
212 \cs_new_protected:Npn \@@_an_indentation_space:
213   { \int_gincr:N \g_@@_indentation_int }
```

The following command `\@@_beamer_command:n` executes the argument corresponding to its argument but also stores it in `\l_@@_beamer_command_str`. That string is used only in the error message “`cr~not~allowed`” raised when there is a carriage return in the mandatory argument of that command.

```
214 \cs_new_protected:Npn \@@_beamer_command:n #1
215   {
216     \str_set:Nn \l_@@_beamer_command_str { #1 }
217     \use:c { #1 }
218 }
```

In the environment `{Piton}`, the command `\label` will be linked to the following command.

```
219 \cs_new_protected:Npn \@@_label:n #1
220   {
221     \bool_if:NTF \l_@@_line_numbers_bool
222       {
223         \bphack
224         \protected@write \auxout { }
225         {
226           \string \newlabel { #1 }
227         }
228       }
```

Remember that the content of a line is typeset in a box *before* the composition of the potential number of line.

```
228       { \int_eval:n { \g_@@_visual_line_int + 1 } }
229       { \thepage }
230     }
231   }
232   \esphack
233 }
234 { \@@_error:n { label-with-lines-numbers } }
```

The following commands corresponds to the keys `marker/beginning` and `marker/end`. The values of that keys are functions that will be applied to the “`range`” specified by the final user in an individual `\PitonInputFile`. They will construct the markers used to find textually in the external file loaded by `piton` the part which must be included (and formatted).

```
236 \cs_new_protected:Npn \@@_marker_beginning:n #1 { }
237 \cs_new_protected:Npn \@@_marker_end:n #1 { }
```

The following commands are a easy way to insert safely braces (`{` and `}`) in the TeX flow.

```
238 \cs_new_protected:Npn \@@_open_brace: { \lua_now:n { piton.open_brace() } }
239 \cs_new_protected:Npn \@@_close_brace: { \lua_now:n { piton.close_brace() } }
```

The following token list will be evaluated at the beginning of `\@@_begin_line:...` `\@@_end_line:` and cleared at the end. It will be used by LPEG acting between the lines of the Python code in order to add instructions to be executed at the beginning of the line.

```
240 \tl_new:N \g_@@_begin_line_hook_tl
```

For example, the LPEG Prompt will trigger the following command which will insert an instruction in the hook `\g_@@_begin_line_hook` to specify that a background must be inserted to the current line of code.

```

241 \cs_new_protected:Npn \@@_prompt:
242 {
243     \tl_gset:Nn \g_@@_begin_line_hook_tl
244     {
245         \tl_if_empty:NF \l_@@_prompt_bg_color_tl
246         { \clist_set:NV \l_@@_bg_color_clist \l_@@_prompt_bg_color_tl }
247     }
248 }
```

### 10.2.3 Treatment of a line of code

The following command is only used once.

```

249 \cs_new_protected:Npn \@@_replace_spaces:n #1
250 {
251     \tl_set:Nn \l_tmpa_tl { #1 }
252     \bool_if:NTF \l_@@_show_spaces_bool
253     {
254         \tl_set:Nn \l_@@_space_tl { \u{20} }
255         \regex_replace_all:nnN { \x20 } { \u{20} } \l_tmpa_tl % U+2423
256     }
257 }
```

If the key `break-lines-in-Piton` is in force, we replace all the characters U+0020 (that is to say the spaces) by `\@@_breakable_space:`. Remark that, except the spaces inserted in the LaTeX comments (and maybe in the math comments), all these spaces are of catcode “other” (=12) and are unbreakable.

```

258     \bool_if:NT \l_@@_break_lines_in_Piton_bool
259     {
260         \regex_replace_all:nnN
261         { \x20 }
262         { \c{@@_breakable_space}: }
263         \l_tmpa_tl
264     }
265 }
266 \l_tmpa_tl
267 }
```

In the contents provided by Lua, each line of the Python code will be surrounded by `\@@_begin_line:` and `\@@_end_line:`. `\@@_begin_line:` is a LaTeX command that we will define now but `\@@_end_line:` is only a syntactic marker that has no definition.

```

268 \cs_set_protected:Npn \@@_begin_line: #1 \@@_end_line:
269 {
270     \group_begin:
271     \g_@@_begin_line_hook_tl
272     \int_gzero:N \g_@@_indentation_int
```

First, we will put in the coffin `\l_tmpa_coffin` the actual content of a line of the code (without the potential number of line).

Be careful: There is curryfication in the following code.

```

273     \bool_if:NTF \l_@@_width_min_bool
274         \@@_put_in_coffin_i:i:n
275         \@@_put_in_coffin_i:i:n
276         {
277             \language = -1
278             \raggedright
279             \strut
280             \@@_replace_spaces:n { #1 }
```

```

281           \strut \hfil
282       }
283   \hbox_set:Nn \l_tmpa_box
284   {
285     \skip_horizontal:N \l_@@_left_margin_dim
286     \bool_if:NT \l_@@_line_numbers_bool
287     {
288       \bool_if:nF
289       {
290         \str_if_eq_p:nn { #1 } { \PitonStyle {Prompt}{} }
291         &&
292         \l_@@_skip_empty_lines_bool
293       }
294       { \int_gincr:N \g_@@_visual_line_int }
295     \bool_if:nT
296     {
297       ! \str_if_eq_p:nn { #1 } { \PitonStyle {Prompt}{} }
298       ||
299       ( ! \l_@@_skip_empty_lines_bool && \l_@@_label_empty_lines_bool )
300     }
301     \@@_print_number:
302   }

```

If there is a background, we must remind that there is a left margin of 0.5 em for the background...

```

303   \clist_if_empty:NF \l_@@_bg_color_clist
304   {
305     ... but if only if the key left-margin is not used !
306     \dim_compare:nNnT \l_@@_left_margin_dim = \c_zero_dim
307     { \skip_horizontal:n { 0.5 em } }
308   }
309   \coffin_typeset:Nnnnn \l_tmpa_coffin T 1 \c_zero_dim \c_zero_dim
310   \box_set_dp:Nn \l_tmpa_box { \box_dp:N \l_tmpa_box + 1.25 pt }
311   \box_set_ht:Nn \l_tmpa_box { \box_ht:N \l_tmpa_box + 1.25 pt }
312   \clist_if_empty:NTF \l_@@_bg_color_clist
313   { \box_use_drop:N \l_tmpa_box }
314   {
315     \vtop
316     {
317       \hbox:n
318       {
319         \@@_color:N \l_@@_bg_color_clist
320         \vrule height \box_ht:N \l_tmpa_box
321             depth \box_dp:N \l_tmpa_box
322             width \l_@@_width_dim
323       }
324       \skip_vertical:n { - \box_ht_plus_dp:N \l_tmpa_box }
325       \box_use_drop:N \l_tmpa_box
326     }
327   }
328   \vspace { - 2.5 pt }
329   \group_end:
330   \tl_gclear:N \g_@@_begin_line_hook_tl
331 }

```

In the general case (which is also the simpler), the key `width` is not used, or (if used) it is not used with the special value `min`. In that case, the content of a line of code is composed in a vertical coffin with a width equal to `\l_@@_line_width_dim`. That coffin may, eventually, contains several lines when the key `broken-lines-in-Piton` (or `broken-lines`) is used.

That commands takes in its argument by curryfication.

```
332 \cs_set_protected:Npn \@@_put_in_coffin_i:n
```

```
333 { \vcoffin_set:Nnn \l_tmpa_coffin \l_@@_line_width_dim }
```

The second case is the case when the key `width` is used with the special value `min`.

```
334 \cs_set_protected:Npn \@@_put_in_coffin_i:n #1
335 {
```

First, we compute the natural width of the line of code because we have to compute the natural width of the whole listing (and it will be written on the `aux` file in the variable `\l_@@_width_dim`).

```
336 \hbox_set:Nn \l_tmpa_box { #1 }
```

Now, you can actualize the value of `\g_@@_tmp_width_dim` (it will be used to write on the `aux` file the natural width of the environment).

```
337 \dim_compare:nNnT { \box_wd:N \l_tmpa_box } > \g_@@_tmp_width_dim
338 { \dim_gset:Nn \g_@@_tmp_width_dim { \box_wd:N \l_tmpa_box } }
339 \hcoffin_set:Nn \l_tmpa_coffin
340 {
341     \hbox_to_wd:nn \l_@@_line_width_dim
```

We unpack the block in order to free the potential `\hfill` springs present in the LaTeX comments (cf. section 8.2, p. 21).

```
342     { \hbox_unpack:N \l_tmpa_box \hfil }
343 }
344 }
```

The command `\@@_color:N` will take in as argument a reference to a comma-separated list of colors. A color will be picked by using the value of `\g_@@_line_int` (modulo the number of colors in the list).

```
345 \cs_set_protected:Npn \@@_color:N #1
346 {
347     \int_set:Nn \l_tmpa_int { \clist_count:N #1 }
348     \int_set:Nn \l_tmpb_int { \int_mod:nn \g_@@_line_int \l_tmpa_int + 1 }
349     \tl_set:Nx \l_tmpa_tl { \clist_item:Nn #1 \l_tmpb_int }
350     \tl_if_eq:NnTF \l_tmpa_tl { none }
```

By setting `\l_@@_width_dim` to zero, the colored rectangle will be drawn with zero width and, thus, it will be a mere strut (and we need that strut).

```
351     { \dim_zero:N \l_@@_width_dim }
352     { \exp_args:NV \@@_color_i:n \l_tmpa_tl }
353 }
```

The following command `\@@_color:n` will accept both the instruction `\@@_color:n { red!15 }` and the instruction `\@@_color:n { [rgb]{0.9,0.9,0} }`.

```
354 \cs_set_protected:Npn \@@_color_i:n #1
355 {
356     \tl_if_head_eq_meaning:nNTF { #1 } [
357         {
358             \tl_set:Nn \l_tmpa_tl { #1 }
359             \tl_set_rescan:Nno \l_tmpa_tl { } \l_tmpa_tl
360             \exp_last_unbraced:No \color \l_tmpa_tl
361         }
362         { \color { #1 } }
363     }
```

  

```
364 \cs_new_protected:Npn \@@_newline:
365 {
366     \int_gincr:N \g_@@_line_int
367     \int_compare:nNnT \g_@@_line_int > { \l_@@_splittable_int - 1 }
368     {
369         \int_compare:nNnT

485 }
```

Be careful! The name of the following set of keys must be considered as public! Hence, it should *not* be changed.

```
486 \keys_define:nn { PitonOptions }
```

```
487 {
```

First, we put keys that should be available only in the preamble.

```
488 detected-commands .code:n =
489     \lua_now:n { piton.addDetectedCommands('#1') } ,
490 detected-commands .value_required:n = true ,
491 detected-commands .usage:n = preamble ,
492 detected-beamer-commands .code:n =
493     \lua_now:n { piton.addBeamerCommands('#1') } ,
494 detected-beamer-commands .value_required:n = true ,
495 detected-beamer-commands .usage:n = preamble ,
496 detected-beamer-environments .code:n =
497     \lua_now:n { piton.addBeamerEnvironments('#1') } ,
498 detected-beamer-environments .value_required:n = true ,
499 detected-beamer-environments .usage:n = preamble ,
```

Remark that the command `\lua_escape:n` is fully expandable. That's why we use `\lua_now:e`.

```
500 begin-escape .code:n =
501     \lua_now:e { piton.begin_escape = "\lua_escape:n{#1}" } ,
502 begin-escape .value_required:n = true ,
503 begin-escape .usage:n = preamble ,
504
505 end-escape .code:n =
506     \lua_now:e { piton.end_escape = "\lua_escape:n{#1}" } ,
507 end-escape .value_required:n = true ,
508 end-escape .usage:n = preamble ,
509

```

```

667 {
668   \bool_set_true:N \l_@@_in_PitonOptions_bool
669   \keys_set:nn { PitonOptions } { #1 }
670   \bool_set_false:N \l_@@_in_PitonOptions_bool
671 }
```

When using `\NewPitonEnvironment` a user may use `\PitonOptions` inside. However, the set of keys available should be different than in standard `\PitonOptions`. That's why we define a version of `\PitonOptions` with no restriction on the set of available keys and we will link that version to `\PitonOptions` in such environment.

```

672 \NewDocumentCommand \@@_fake_PitonOptions { }
673   { \keys_set:nn { PitonOptions } }
```

### 10.2.5 The numbers of the lines

The following counter will be used to count the lines in the code when the user requires the numbers of the lines to be printed (with `line-numbers`).

```

674 \int_new:N \g_@@_visual_line_int
675 \cs_new_protected:Npn \@@_incr_visual_line:
676 {
677   \bool_if:NF \l_@@_skip_empty_lines_bool
678     { \int_gincr:N \g_@@_visual_line_int }
679 }
680 \cs_new_protected:Npn \@@_print_number:
681 {
682   \hbox_overlap_left:n
683   {
684     {
685       \l_@@_line_numbers_format_tl
686       \int_to_arabic:n \g_@@_visual_line_int
687     }
688     \skip_horizontal:N \l_@@_numbers_sep_dim
689   }
690 }
```

### 10.2.6 The command to write on the aux file

```

691 \cs_new_protected:Npn \@@_write_aux:
692 {
693   \tl_if_empty:NF \g_@@_aux_tl
694   {
695     \iow_now:Nn \mainaux { \ExplSyntaxOn }
696     \iow_now:Nx \mainaux
697     {
698       \tl_gset:cn { c_@@_ \int_use:N \g_@@_env_int _ tl }
699       { \exp_not:o \g_@@_aux_tl }
700     }
701     \iow_now:Nn \mainaux { \ExplSyntaxOff }
702   }
703   \tl_gclear:N \g_@@_aux_tl
704 }
```

The following macro will be used only when the key `width` is used with the special value `min`.

```

705 \cs_new_protected:Npn \@@_width_to_aux:
706 {
707   \tl_gput_right:Nx \g_@@_aux_tl
708   {
709     \dim_set:Nn \l_@@_line_width_dim
710     { \dim_eval:n { \g_@@_tmp_width_dim } }
```

```

711     }
712 }
```

### 10.2.7 The main commands and environments for the final user

```

713 \NewDocumentCommand { \NewPitonLanguage } { O { } m ! o }
714 {
715     \tl_if_no_value:nTF { #3 }
```

The last argument is provided by currying.

```

716     { \@@_NewPitonLanguage:nnn { #1 } { #2 } }
```

The two last arguments are provided by currying.

```

717     { \@@_NewPitonLanguage:nnnn { #1 } { #2 } { #3 } }
718 }
```

The following property list will contain the definitions of the informatic languages as provided by the final user. However, if a language is defined over another base language, the corresponding list will contain the *whole* definition of the language.

```

719 \prop_new:N \g_@@_languages_prop
```

```

720 \keys_define:nn { NewPitonLanguage }
721 {
722     morekeywords .code:n = ,
723     otherkeywords .code:n = ,
724     sensitive .code:n = ,
725     keywordsprefix .code:n = ,
726     moretexcs .code:n = ,
727     morestring .code:n = ,
728     morecomment .code:n = ,
729     moredelim .code:n = ,
730     moredirectives .code:n = ,
731     tag .code:n = ,
732     alsodigit .code:n = ,
733     alsoletter .code:n = ,
734     alsoother .code:n = ,
735     unknown .code:n = \@@_error:n { Unknown~key~NewPitonLanguage }
736 }
```

The function `\@@_NewPitonLanguage:nnn` will be used when the language is *not* defined above a base language (and a base dialect).

```

737 \cs_new_protected:Npn \@@_NewPitonLanguage:nnn #1 #2 #3
738 {
```

We store in `\l_tmpa_tl` the name of the language with the potential dialect, that is to say, for example : [AspectJ]{Java}. We use `\tl_if_blank:nF` because the final user may have written `\NewPitonLanguage[ ]{Java}{...}`.

```

739     \tl_set:Nx \l_tmpa_tl
740     {
741         \tl_if_blank:nF { #1 } { [ \str_lowercase:n { #1 } ] }
742         \str_lowercase:n { #2 }
743     }
```

The following set of keys is only used to raise an error when a key is unknown!

```

744 \keys_set:nn { NewPitonLanguage } { #3 }
```

We store in LaTeX the definition of the language because some languages may be defined with that language as base language.

```

745 \prop_gput:Non \g_@@_languages_prop \l_tmpa_tl { #3 }
```

The Lua part of the package `piton` will be loaded in a `\AtBeginDocument`. Hence, we will put also in a `\AtBeginDocument` the utilisation of the Lua function `piton.new_language` (which does the main job).

```

746 \exp_args:NV \@@_NewPitonLanguage:nn \l_tmpa_tl { #3 }
```

```

747    }
748 \cs_new_protected:Npn \@@_NewPitonLanguage:nn #1 #2
749 {
750     \hook_gput_code:nnn { begindocument } { . }
751     { \lua_now:e { piton.new_language("#1", "\lua_escape:n{#2}") } }
752 }

```

Now the case when the language is defined upon a base language.

```

753 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnn #1 #2 #3 #4 #5
754 {

```

We store in \l\_tmpa\_t1 the name of the base language with the dialect, that is to say, for example : [AspectJ]{Java}. We use \tl\_if\_blank:nF because the final user may have used \NewPitonLanguage[Handel]{C}[]{}{...}

```

755     \tl_set:Nx \l_tmpa_t1
756     {
757         \tl_if_blank:nF { #3 } { [ \str_lowercase:n { #3 } ] }
758         \str_lowercase:n { #4 }
759     }

```

We retrieve in \l\_tmpb\_t1 the definition (as provided by the final user) of that base language. Caution: \g\_@@\_languages\_prop does not contain all the languages provided by piton but only those defined by using \NewPitonLanguage.

```

760     \prop_get:NoNTF \g_@@_languages_prop \l_tmpa_t1 \l_tmpb_t1

```

We can now define the new language by using the previous function.

```

761     { \@@_NewPitonLanguage:nnno { #1 } { #2 } { #5 } \l_tmpb_t1 }
762     { \@@_error:n { Language-not-defined } }
763 }

```

```

764 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnn #1 #2 #3 #4

```

In the following line, we write #4,#3 and not #3,#4 because we want that the keys which correspond to base language appear before the keys which are added in the language we define.

```

765     { \@@_NewPitonLanguage:nnn { #1 } { #2 } { #4 , #3 } }
766 \cs_generate_variant:Nn \@@_NewPitonLanguage:nnnn { n n n o }

938 \cs_generate_variant:Nn \@@_compute_left_margin:nn { n o }

```

Whereas `\l_@@_width_dim` is the width of the environment, `\l_@@_line_width_dim` is the width of the lines of code without the potential margins for the numbers of lines and the background. Depending on the case, you have to compute `\l_@@_line_width_dim` from `\l_@@_width_dim` or we have to do the opposite.

```

919 \cs_new_protected:Npn \@@_compute_width:
920 {
921     \dim_compare:nNnTF \l_@@_line_width_dim = \c_zero_dim
922     {
923         \dim_set_eq:NN \l_@@_line_width_dim \l_@@_width_dim
924         \clist_if_empty:NTF \l_@@_bg_color_clist

```

If there is no background, we only subtract the left margin.

```
925         { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }
```

If there is a background, we subtract 0.5 em for the margin on the right.

```

926     {
927         \dim_sub:Nn \l_@@_line_width_dim { 0.5 em }

```

And we subtract also for the left margin. If the key `left-margin` has been used (with a numerical value or with the special value `min`), `\l_@@_left_margin_dim` has a non-zero value<sup>33</sup> and we use that value. Elsewhere, we use a value of 0.5 em.

```

928     \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
929         { \dim_sub:Nn \l_@@_line_width_dim { 0.5 em } }
930         { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }
931     }
932 }
```

If `\l_@@_line_width_dim` has yet a non-zero value, that means that it has been read in the `aux` file: it has been written by a previous run because the key `width` is used with the special value `min`). We compute now the width of the environment by computations opposite to the preceding ones.

```

933     {
934         \dim_set_eq:NN \l_@@_width_dim \l_@@_line_width_dim
935         \clist_if_empty:NTF \l_@@_bg_color_clist

```

---

<sup>33</sup>If the key `left-margin` has been used with the special value `min`, the actual value of `\l_@@_left_margin_dim` has yet been computed when we use the current command.

```

936     { \dim_add:Nn \l_@@_width_dim \l_@@_left_margin_dim }
937     {
938         \dim_add:Nn \l_@@_width_dim { 0.5 em }
939         \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
940             { \dim_add:Nn \l_@@_width_dim { 0.5 em } }
941             { \dim_add:Nn \l_@@_width_dim \l_@@_left_margin_dim }
942     }
943 }
944 }

945 \NewDocumentCommand { \NewPitonEnvironment } { m m m m }
946 {

```

We construct a TeX macro which will catch as argument all the tokens until `\end{name_env}` with, in that `\end{name_env}`, the catcodes of `\`, `{` and `}` equal to 12 (“other”). The latter explains why the definition of that function is a bit complicated.

```

947 \use:x
948 {
949     \cs_set_protected:Npn
950         \use:c { _@@_collect_ #1 :w }
951         ####1
952         \c_backslash_str end \c_left_brace_str #1 \c_right_brace_str
953     }
954     {
955         \group_end:
956         \mode_if_vertical:TF \mode_leave_vertical: \newline

```

We count with Lua the number of lines of the argument. The result will be stored by Lua in `\l_@@_nb_lines_int`. That information will be used to allow or disallow page breaks. The use of `token.scan_argument` avoids problems with the delimiters of the Lua string.

```
957     \lua_now:n { piton.CountLines(token.scan_argument()) } { ##1 }
```

The first argument of the following function is the name of the Lua function that will be applied to the second argument in order to count the number of lines.

```

958     \@@_compute_left_margin:nn { CountNonEmptyLines } { ##1 }
959     \@@_compute_width:
960     \ttfamily
961     \dim_zero:N \parskip

```

Now, the key `write`.

```

962     \str_if_empty:NTF \l_@@_path_write_str
963     { \lua_now:e { piton.write = "\l_@@_write_str" } }
964     {
965         \lua_now:e
966         { piton.write = "\l_@@_path_write_str / \l_@@_write_str" }
967     }
968     \str_if_empty:NTF \l_@@_write_str
969     { \lua_now:n { piton.write = '' } }
970     {
971         \seq_if_in:NVTF \g_@@_write_seq \l_@@_write_str
972         { \lua_now:n { piton.write_mode = "a" } }
973         {
974             \lua_now:n { piton.write_mode = "w" }
975             \seq_gput_left:NV \g_@@_write_seq \l_@@_write_str
976         }
977     }

```

Now, the main job.

```

978     \bool_if:NTF \l_@@_split_on_empty_lines_bool
979         \@@_gobble_split_parse:n
980         \@@_gobble_parse:n
981         { ##1 }

```

If the user has used the key `width` with the special value `min`, we write on the `aux` file the value of `\l_@@_line_width_dim` (largest width of the lines of code of the environment).

```
982           \bool_if:NT \l_@@_width_min_bool \@@_width_to_aux:
```

The following `\end{#1}` is only for the stack of environments of LaTeX.

```
983           \end { #1 }
984           \@@_write_aux:
985       }
```

We can now define the new environment.

We are still in the definition of the command `\NewPitonEnvironment`...

```
986   \NewDocumentEnvironment { #1 } { #2 }
987   {
988     \cs_set_eq:NN \PitonOptions \@@_fake_PitonOptions
989     #3
990     \@@_pre_env:
991     \int_compare:nNnT \l_@@_number_lines_start_int > \c_zero_int
992       { \int_gset:Nn \g_@@_visual_line_int { \l_@@_number_lines_start_int - 1 } }
993     \group_begin:
994     \tl_map_function:nN
995       { \ \\ \{ \} \$ \& \^ \_ \% \~ \^\I }
996       \char_set_catcode_other:N
997     \use:c { _@@_collect_ #1 :w }
998   }
999   { #4 }
```

The following code is for technical reasons. We want to change the catcode of `\^\M` before catching the arguments of the new environment we are defining. Indeed, if not, we will have problems if there is a final optional argument in our environment (if that final argument is not used by the user in an instance of the environment, a spurious space is inserted, probably because the `\^\M` is converted to space).

```
1000   \AddToHook { env / #1 / begin } { \char_set_catcode_other:N \^\M }
1001 }
```

This is the end of the definition of the command `\NewPitonEnvironment`.

The following function will be used when the key `split-on-empty-lines` is not in force. It will gobble the spaces at the beginning of the lines and parse the code. The argument is provided by curryfication.

```
1002 \cs_new_protected:Npn \@@_gobble_parse:n
1003 {
1004   \lua_now:e
1005   {
1006     piton.GobbleParse
1007     (
1008       '\l_piton_language_str' ,
1009       \int_use:N \l_@@_gobble_int ,
1010       token.scan_argument ( )
1011     )
1012   }
1013 }
```

The following function will be used when the key `split-on-empty-lines` is in force. It will gobble the spaces at the beginning of the lines (if the key `gobble` is in force), then split the code at the empty lines and, eventually, parse the code. The argument is provided by curryfication.

```
1014 \cs_new_protected:Npn \@@_gobble_split_parse:n
1015 {
1016   \lua_now:e
1017   {
1018     piton.GobbleSplitParse
1019     (
1020       '\l_piton_language_str' ,
1021       \int_use:N \l_@@_gobble_int ,
1022       token.scan_argument ( )
1023     )
1024 }
```

```

1024     }
1025 }

Now, we define the environment {Piton}, which is the main environment provided by the package
piton. Of course, you use \NewPitonEnvironment.

1026 \bool_if:NTF \g_@@_beamer_bool
1027 {
1028   \NewPitonEnvironment { Piton } { d < > 0 { } }
1029   {
1030     \keys_set:nn { PitonOptions } { #2 }
1031     \tl_if_no_value:nTF { #1 }
1032     {
1033       \begin{uncoverenv}
1034       \begin{uncoverenv} < #1 >
1035     }
1036   }
1037   {
1038     \NewPitonEnvironment { Piton } { 0 { } }
1039     \keys_set:nn { PitonOptions } { #1 }
1040     {
1041   }

```

The code of the command \PitonInputFile is somewhat similar to the code of the environment {Piton}. In fact, it's simpler because there isn't the problem of catching the content of the environment in a verbatim mode.

```

1042 \NewDocumentCommand { \PitonInputFileTF } { d < > 0 { } m m m }
1043 {
1044   \group_begin:

```

The boolean \l\_tmap\_bool will be raised if the file is found somewhere in the path (specified by the key path).

```

1045   \bool_set_false:N \l_tmpa_bool

```

```

1235 ParseAgain.noCR .tl_set:c = pitonStyle _ ParseAgain.noCR ,
1236 ParseAgain.noCR .value_required:n = true ,
1237 unknown .code:n =
1238     \@@_error:n { Unknown~key~for~SetPitonStyle }
1239 }
```

We add the word `String` to the list of the styles because we will use that list in the error message for an unknown key in `\SetPitonStyle`.

```
1240 \clist_gput_left:Nn \g_@@_styles_clist { String }
```

Of course, we sort that clist.

```

1241 \clist_gsort:Nn \g_@@_styles_clist
1242 {
1243     \str_compare:nNnTF { #1 } < { #2 }
1244         \sort_return_same:
1245         \sort_return_swapped:
1246 }
```

### 10.2.9 The initial styles

The initial styles are inspired by the style “manni” of Pygments.

```

1247 \SetPitonStyle
1248 {
1249     Comment          = \color[HTML]{0099FF} \itshape ,
1250     Exception        = \color[HTML]{CC0000} ,
1251     Keyword          = \color[HTML]{006699} \bfseries ,
1252     Keyword.Constant = \color[HTML]{006699} \bfseries ,
1253     Name.Builtin     = \color[HTML]{336666} ,
1254     Name.Decorator   = \color[HTML]{9999FF},
1255     Name.Class       = \color[HTML]{00AA88} \bfseries ,
1256     Name.Function    = \color[HTML]{CC00FF} ,
1257     Name.Namespace   = \color[HTML]{00CCFF} ,
1258     Name.Constructor = \color[HTML]{006000} \bfseries ,
1259     Name.Field       = \color[HTML]{AA6600} ,
1260     Name.Module      = \color[HTML]{0060A0} \bfseries ,
1261     Name.Table       = \color[HTML]{309030} ,
1262     Number           = \color[HTML]{FF6600} ,
1263     Operator          = \color[HTML]{555555} ,
1264     Operator.Word    = \bfseries ,
1265     String            = \color[HTML]{CC3300} ,
1266     String.Doc       = \color[HTML]{CC3300} \itshape ,
1267     String.Interpol  = \color[HTML]{AA0000} ,
1268     Comment.LaTeX    = \normalfont \color[rgb]{.468,.532,.6} ,
1269     Name.Type         = \color[HTML]{336666} ,
1270     InitialValues   = \@@_piton:n ,
1271     Interpol.Inside  = \color{black}\@@_piton:n ,
1272     TypeParameter   = \color[HTML]{336666} \itshape ,
1273     Preproc           = \color[HTML]{AA6600} \slshape ,
1274     Identifier        = \@@_identifier:n ,
1275     Directive         = \color[HTML]{AA6600} ,
1276     Tag               = \colorbox{gray!10},
1277     UserFunction      = ,
1278     Prompt             = ,
1279     ParseAgain.noCR  = \@@_piton_no_cr:n ,
1280     ParseAgain        = \@@_piton:n ,
1281     Discard           = \use_none:n
1282 }
```

The last styles `ParseAgain.noCR` and `ParseAgain` should be considered as “internal style” (not available for the final user). However, maybe we will change that and document these styles for the final user (why not?).

If the key `math-comments` has been used at load-time, we change the style `Comment.Math` which should be considered only at an “internal style”. However, maybe we will document in a future version the possibility to write change the style *locally* in a document].

```
1283 \AtBeginDocument
1284 {
1285   \bool_if:NT \g_@@_math_comments_bool
1286     { \SetPitonStyle { Comment.Math = \g_@@_math_scantokens:n } }
1287 }
```

### 10.2.10 Highlighting some identifiers

```
1288 \NewDocumentCommand { \SetPitonIdentifier } { o m m }
1289 {
1290   \clist_set:Nn \l_tmpa_clist { #2 }
1291   \tl_if_no_value:nTF { #1 }
1292   {
1293     \clist_map_inline:Nn \l_tmpa_clist
1294       { \cs_set:cpn { PitonIdentifier _ ##1 } { #3 } }
1295   }
1296   {
1297     \str_set:Nx \l_tmpa_str { \str_lowercase:n { #1 } }
1298     \str_if_eq:onT \l_tmpa_str { current-language }
1299       { \str_set_eq:NN \l_tmpa_str \l_piton_language_str }
1300     \clist_map_inline:Nn \l_tmpa_clist
1301       { \cs_set:cpn { PitonIdentifier _ \l_tmpa_str _ ##1 } { #3 } }
1302   }
1303 }
1304 \cs_new_protected:Npn \g_@@_identifier:n #1
1305 {
1306   \cs_if_exist_use:cF { PitonIdentifier _ \l_piton_language_str _ #1 }
1307     { \cs_if_exist_use:c { PitonIdentifier _ #1 } }
1308   { #1 }
1309 }
```

In particular, we have an highlighting of the identifiers which are the names of Python functions previously defined by the user. Indeed, when a Python function is defined, the style `Name.Function.Internal` is applied to that name. We define now that style (you define it directly and you short-cut the function `\SetPitonStyle`).

```
1310 \cs_new_protected:cpn { pitonStyle _ Name.Function.Internal } #1
1311 {
```

First, the element is composed in the TeX flow with the style `Name.Function` which is provided to the final user.

```
1312   { \PitonStyle { Name.Function } { #1 } }
```

Now, we specify that the name of the new Python function is a known identifier that will be formatted with the Piton style `UserFunction`. Of course, here the affectation is global because we have to exit many groups and even the environments `{Piton}`.

```
1313   \cs_gset_protected:cpn { PitonIdentifier _ \l_piton_language_str _ #1 }
1314     { \PitonStyle { UserFunction } }
```

Now, we put the name of that new user function in the dedicated sequence (specific of the current language). **That sequence will be used only by `\PitonClearUserFunctions`.**

```
1315   \seq_if_exist:cF { g_@@_functions _ \l_piton_language_str _ seq }
1316     { \seq_new:c { g_@@_functions _ \l_piton_language_str _ seq } }
1317   \seq_gput_right:cn { g_@@_functions _ \l_piton_language_str _ seq } { #1 }
```

We update `\g_@@_languages_seq` which is used only by the command `\PitonClearUserFunctions` when it's used without its optional argument.

```

1318 \seq_if_in:NVF \g_@@_languages_seq \l_piton_language_str
1319   { \seq_gput_left:NV \g_@@_languages_seq \l_piton_language_str }
1320 }

1321 \NewDocumentCommand \PitonClearUserFunctions { ! o }
1322   {
1323     \tl_if_novalue:nTF { #1 }

If the command is used without its optional argument, we will deleted the user language for all the
informatic languages.
1324   { \@@_clear_all_functions: }
1325   { \@@_clear_list_functions:n { #1 } }

1326 }

1327 \cs_new_protected:Npn \@@_clear_list_functions:n #1
1328   {
1329     \clist_set:Nn \l_tmpa_clist { #1 }
1330     \clist_map_function:NN \l_tmpa_clist \@@_clear_functions_i:n
1331     \clist_map_inline:nn { #1 }
1332     { \seq_gremove_all:Nn \g_@@_languages_seq { ##1 } }
1333   }

1334 \cs_new_protected:Npn \@@_clear_functions_i:n #1
1335   { \exp_args:Ne \@@_clear_functions_ii:n { \str_lowercase:n { #1 } } }

The following command clears the list of the user-defined functions for the language provided in
argument (mandatory in lower case).
1336 \cs_new_protected:Npn \@@_clear_functions_ii:n #1
1337   {
1338     \seq_if_exist:cT { g_@@_functions _ #1 _ seq }
1339     {
1340       \seq_map_inline:cn { g_@@_functions _ #1 _ seq }
1341       { \cs_undefine:c { PitonIdentifier _ #1 _ ##1 } }
1342       \seq_gclear:c { g_@@_functions _ #1 _ seq }
1343     }
1344   }

1345 \cs_new_protected:Npn \@@_clear_functions:n #1
1346   {
1347     \@@_clear_functions_i:n { #1 }
1348     \seq_gremove_all:Nn \g_@@_languages_seq { #1 }
1349   }

The following command clears all the user-defined functions for all the informatic languages.
1350 \cs_new_protected:Npn \@@_clear_all_functions:
1351   {
1352     \seq_map_function:NN \g_@@_languages_seq \@@_clear_functions_i:n
1353     \seq_gclear:N \g_@@_languages_seq
1354   }
```

1519 }  

  

1520 \hook_gput_code:nnn { begindocument } { . }  

1521 {  

1522   \lua_now:n  

1523   {  

1524     require ( "piton" )  

1525     tex.sprint ( luatexbase.catcodetables.CatcodeTableExpl ,  

1526                 "\\\@_test_version:n {" .. piton_version .. "}" )  

1527   }  

1528 }

```

### 10.2.14 Detected commands

```

1529 \ExplSyntaxOff  

1530 \begin{luacode*}  

1531   lpeg.locale(lpeg)  

1532   local P , alpha , C , space , S , V

```

```

1533     = lpeg.P , lpeg.alpha , lpeg.C , lpeg.space , lpeg.S , lpeg.V
1534 local function add(...)
1535     local s = P ( false )
1536     for _ , x in ipairs({...}) do s = s + x end
1537     return s
1538 end
1539 local my_lpeg =
1540   P { "E" ,
1541       E = ( V "F" * ( "," * V "F" ) ^ 0 ) / add ,

```

Be careful: in Lua, `/` has no priority over `*`. Of course, we want a behaviour for this comma-separated list equal to the behaviour of a `clist` of L3.

```

1542     F = space ^ 0 * ( ( alpha ^ 1 ) / "\\" % 0 ) * space ^ 0
1543   }
1544   function piton.addDetectedCommands( key_value )
1545     piton.DetectedCommands = piton.DetectedCommands + my_lpeg : match ( key_value )
1546   end
1547   function piton.addBeamerCommands( key_value )
1548     piton.BeamerCommands
1549     = piton.BeamerCommands + my_lpeg : match ( key_value )
1550   end
1551   local function insert(...)
1552     local s = piton.beamer_environments
1553     for _ , x in ipairs({...}) do table.insert(s,x) end
1554     return s
1555   end
1556   local my_lpeg_bis =
1557     P { "E" ,
1558         E = ( V "F" * ( "," * V "F" ) ^ 0 ) / insert ,
1559         F = space ^ 0 * ( alpha ^ 1 ) * space ^ 0
1560     }
1561   function piton.addBeamerEnvironments( key_value )
1562     piton.beamer_environments = my_lpeg_bis : match ( key_value )
1563   end
1564 \end{luacode*}
1565 
```

### 10.3 The Lua part of the implementation

The Lua code will be loaded via a `{luacode*}` environment. The environment is by itself a Lua block and the local declarations will be local to that block. All the global functions (used by the L3 parts of the implementation) will be put in a Lua table `piton`.

```

1566 (*LUA)
1567 if piton.comment_latex == nil then piton.comment_latex = ">" end
1568 piton.comment_latex = "#" .. piton.comment_latex

```

The following functions are an easy way to safely insert braces (`{` and `}`) in the TeX flow.

```

1569 function piton.open_brace ()
1570   tex.sprint("{")
1571 end
1572 function piton.close_brace ()
1573   tex.sprint("}")
1574 end
1575 local function sprintL3 ( s )
1576   tex.sprint ( luatexbase.catcodetables.expl , s )
1577 end

```

### 10.3.1 Special functions dealing with LPEG

We will use the Lua library `lpeg` which is built in LuaTeX. That's why we define first aliases for several functions of that library.

```
1578 local P, S, V, C, Ct, Cc = lpeg.P, lpeg.S, lpeg.V, lpeg.C, lpeg.Ct, lpeg.Cc
1579 local Cs, Cg, Cmt, Cb = lpeg.Cs, lpeg.Cg, lpeg.Cmt, lpeg.Cb
1580 local R = lpeg.R
```

The function `Q` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with the catcode “other” for all the characters: it's suitable for elements of the Python listings that `piton` will typeset verbatim (thanks to the catcode “other”).

```
1581 local function Q ( pattern )
1582     return Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther ) * C ( pattern ) )
1583 end
```

The function `L` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with standard LaTeX catcodes for all the characters: the elements captured will be formatted as normal LaTeX codes. It's suitable for the “LaTeX comments” in the environments `{Piton}` and the elements between `begin-escape` and `end-escape`. That function won't be much used.

```
1584 local function L ( pattern )
1585     return Ct ( C ( pattern ) )
1586 end
```

The function `Lc` (the `c` is for *constant*) takes in as argument a string and returns a LPEG *with does a constant capture* which returns that string. The elements captured will be formatted as L3 code. It will be used to send to LaTeX all the formatting LaTeX instructions we have to insert in order to do the syntactic highlighting (that's the main job of `piton`). That function, unlike the previous one, will be widely used.

```
1587 local function Lc ( string )
1588     return Cc ( { luatexbase.catcodetables.expl , string } )
1589 end
```

The function `K` creates a LPEG which will return as capture the whole LaTeX code corresponding to a Python chunk (that is to say with the LaTeX formatting instructions corresponding to the syntactic nature of that Python chunk). The first argument is a Lua string corresponding to the name of a `piton` style and the second element is a pattern (that is to say a LPEG without capture)

```
1590 e
1591 local function K ( style , pattern )
1592     return
1593         Lc ( "{\\PitonStyle{" .. style .. "}}{" )
1594         * Q ( pattern )
1595         * Lc "}""
1596 end
```

The formatting commands in a given `piton` style (eg. the style `Keyword`) may be semi-global declarations (such as `\bfseries` or `\slshape`) or LaTeX macros with an argument (such as `\fbox` or `\colorbox{yellow}`). In order to deal with both syntaxes, we have used two pairs of braces: `{\\PitonStyle{Keyword}{text to format}}`.

The following function `WithStyle` is similar to the function `K` but should be used for multi-lines elements.

```
1597 local function WithStyle ( style , pattern )
1598     return
1599         Ct ( Cc "Open" * Cc ( "{\\PitonStyle{" .. style .. "}}{" ) * Cc "}" )
1600         * pattern
1601         * Ct ( Cc "Close" )
1602 end
```

The following LPEG catches the Python chunks which are in LaTeX escapes (and that chunks will be considered as normal LaTeX constructions).

```

1603 Escape = P ( false )
1604 EscapeClean = P ( false )
1605 if piton.begin_escape ~= nil
1606 then
1607   Escape =
1608     P ( piton.begin_escape )
1609     * L ( ( 1 - P ( piton.end_escape ) ) ^ 1 )
1610     * P ( piton.end_escape )

```

The LPEG `EscapeClean` will be used in the LPEG Clean (and that LPEG is used to “clean” the code by removing the formatting elements).

```

1611 EscapeClean =
1612   P ( piton.begin_escape )
1613   * ( 1 - P ( piton.end_escape ) ) ^ 1
1614   * P ( piton.end_escape )
1615 end

1616 EscapeMath = P ( false )
1617 if piton.begin_escape_math ~= nil
1618 then
1619   EscapeMath =
1620     P ( piton.begin_escape_math )
1621     * Lc "\\ensuremath{"
1622     * L ( ( 1 - P(piton.end_escape_math) ) ^ 1 )
1623     * Lc ( "}" )
1624     * P ( piton.end_escape_math )
1625 end

```

The following line is mandatory.

```
1626 lpeg.locale(lpeg)
```

## The basic syntactic LPEG

```

1627 local alpha , digit = lpeg.alpha , lpeg.digit
1628 local space = P " "

```

Remember that, for LPEG, the Unicode characters such as à, â, ç, etc. are in fact strings of length 2 (2 bytes) because `lpeg` is not Unicode-aware.

```

1629 local letter = alpha + "_" + "â" + "à" + "ç" + "é" + "è" + "ê" + "ë" + "í" + "î"
1630           + "ô" + "û" + "ü" + "Â" + "À" + "Ç" + "É" + "È" + "Ê" + "Ë"
1631           + "Í" + "Î" + "Ô" + "Û" + "Ü"
1632
1633 local alphanum = letter + digit

```

The following LPEG `identifier` is a mere pattern (that is to say more or less a regular expression) which matches the Python identifiers (hence the name).

```
1634 local identifier = letter * alphanum ^ 0
```

On the other hand, the LPEG `Identifier` (with a capital) also returns a *capture*.

```
1635 local Identifier = K ( 'Identifier' , identifier )
```

By convention, we will use names with an initial capital for LPEG which return captures.

Here is the first use of our function `K`. That function will be used to construct LPEG which capture Python chunks for which we have a dedicated `piton` style. For example, for the numbers, `piton` provides a style which is called `Number`. The name of the style is provided as a Lua string in the

second argument of the function K. By convention, we use single quotes for delimiting the Lua strings which are names of piton styles (but this is only a convention).

```

1636 local Number =
1637   K ( 'Number' ,
1638     ( digit ^ 1 * P "." * # ( 1 - P "." ) * digit ^ 0
1639       + digit ^ 0 * P "." * digit ^ 1
1640       + digit ^ 1 )
1641     * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
1642       + digit ^ 1
1643   )

```

We recall that `piton.begin_escape` and `piton_end_escape` are Lua strings corresponding to the keys `begin-escape` and `end-escape`.

```

1644 local Word
1645 if piton.begin_escape then
1646   if piton.begin_escape_math then
1647     Word = Q ( ( 1 - space - piton.begin_escape - piton.end_escape
1648                 - piton.begin_escape_math - piton.end_escape_math
1649                 - S "'\"\\r[({})]" - digit ) ^ 1 )
1650   else
1651     Word = Q ( ( 1 - space - piton.begin_escape - piton.end_escape
1652                   - S "'\"\\r[({})]" - digit ) ^ 1 )
1653   end
1654 else
1655   if piton.begin_escape_math then
1656     Word = Q ( ( 1 - space - piton.begin_escape_math - piton.end_escape_math
1657                   - S "'\"\\r[({})]" - digit ) ^ 1 )
1658   else
1659     Word = Q ( ( 1 - space - S "'\"\\r[({})]" - digit ) ^ 1 )
1660   end
1661 end

1662 local Space = Q " " ^ 1
1663
1664 local SkipSpace = Q " " ^ 0
1665
1666 local Punct = Q ( S ",,:;!" )
1667
1668 local Tab = "\t" * Lc "\\@@_tab:"

1669 local SpaceIndentation = Lc "\\@@_an_indentation_space:" * Q " "
1670 local Delim = Q ( S "[({})]" )

```

The following LPEG catches a space (U+0020) and replace it by `\l_@@_space_t1`. It will be used in the strings. Usually, `\l_@@_space_t1` will contain a space and therefore there won't be difference. However, when the key `show-spaces-in-strings` is in force, `\\\l_@@_space_t1` will contain `□` (U+2423) in order to visualize the spaces.

```
1671 local VisualSpace = space * Lc "\\\l_@@_space_t1"
```

## Several tools for the construction of the main LPEG

```

1672 local LPEG0 = { }
1673 local LPEG1 = { }
1674 local LPEG2 = { }
1675 local LPEG_cleaner = { }

```

For each language, we will need a pattern to match expressions with balanced braces. Those balanced braces must *not* take into account the braces present in strings of the language. However, the syntax for the strings is language-dependent. That's why we write a Lua function `Compute_braces` which will compute the pattern by taking in as argument a pattern for the strings of the language (at least the shorts strings).

```

1676 local function Compute_braces ( lpeg_string ) return
1677     P { "E" ,
1678         E =
1679             (
1680                 "{"
1681                 +
1682                 lpeg_string
1683                 +
1684                 ( 1 - S "{}" )
1685             ) ^ 0
1686     }
1687 end

```

The following Lua function will compute the lpeg `DetectedCommands` which is a LPEG with captures).

```

1688 local function Compute_DetectedCommands ( lang , braces ) return
1689     Ct ( Cc "Open"
1690         * C ( piton.DetectedCommands * P "{" )
1691         * Cc "}"
1692     )
1693     * ( braces
1694         / ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
1695     * P "}"
1696     * Ct ( Cc "Close" )
1697 end

1698 local function Compute_LPEG_cleaner ( lang , braces ) return
1699     Ct ( ( piton.DetectedCommands * "{"
1700         * ( braces
1701             / ( function ( s )
1702                 if s ~= '' then return LPEG_cleaner[lang] : match ( s ) end end ) )
1703             * "}"
1704             + EscapeClean
1705             + C ( P ( 1 ) )
1706         ) ^ 0 ) / table.concat
1707 end

```

**Constructions for Beamer** If the class `Beamer` is used, some environments and commands of `Beamer` are automatically detected in the listings of `piton`.

```

1708 local Beamer = P ( false )
1709 local BeamerBeginEnvironments = P ( true )
1710 local BeamerEndEnvironments = P ( true )

1711 piton.BeamerEnvironments = P ( false )
1712 for _ , x in ipairs ( piton.beamer_environments ) do
1713     piton.BeamerEnvironments = piton.BeamerEnvironments + x
1714 end

```

```

1715 BeamerBeginEnvironments =
1716   ( space ^ 0 *
1717     L
1718     (
1719       P "\begin{" * piton.BeamerEnvironments * "}"
1720       * ("<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1721     )
1722     * "\r"
1723   ) ^ 0

1724 BeamerEndEnvironments =
1725   ( space ^ 0 *
1726     L ( P "\end{" * piton.BeamerEnvironments * "}" )
1727     * "\r"
1728   ) ^ 0

```

The following Lua function will be used to compute the LPEG **Beamer** for each informatic language.

```
1729 local function Compute_Beamer ( lang , braces )
```

We will compute in lpeg the LPEG that we will return.

```

1730 local lpeg = L ( P "\pause" * ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1 )
1731 lpeg = lpeg +
1732   Ct ( Cc "Open"
1733     * C ( piton.BeamerCommands
1734       * ("<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1735       * P "{"
1736       )
1737     * Cc "}"
1738   )
1739   * ( braces /
1740     ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end )
1741   * "}"
1742   * Ct ( Cc "Close" )

```

For the command **\alt**, the specification of the overlays (between angular brackets) is mandatory.

```

1743 lpeg = lpeg +
1744   L ( P "\alt" * "<" * ( 1 - P ">" ) ^ 0 * ">" * "{"
1745   * ( braces /
1746     ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end )
1747   * L ( P "}" )
1748   * ( braces /
1749     ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end )
1750   * L ( P "}" )

```

For **\temporal**, the specification of the overlays (between angular brackets) is mandatory.

```

1751 lpeg = lpeg +
1752   L ( ( P "\temporal" ) * "<" * ( 1 - P ">" ) ^ 0 * ">" * "{"
1753   * ( braces
1754     / ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end )
1755   * L ( P "}" )
1756   * ( braces
1757     / ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end )
1758   * L ( P "}" )
1759   * ( braces
1760     / ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end )
1761   * L ( P "}" )

```

Now, the environments of Beamer.

```

1762     for _, x in ipairs ( piton.beamer_environments ) do
1763         lpeg = lpeg +
1764             Ct ( Cc "Open"
1765                 * C (
1766                     P ( "\begin{" .. x .. "}" )
1767                     * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1768                 )
1769                 * Cc ( "\end{" .. x .. "}" )
1770             )
1771             *
1772                 ( ( 1 - P ( "\end{" .. x .. "}" ) ) ^ 0 )
1773                 / ( function ( s )
1774                     if s ~= ''
1775                     then return LPEG1[lang] : match ( s )
1776                     end
1777                     end )
1778                 )
1779                 * P ( "\end{" .. x .. "}" )
1780                 * Ct ( Cc "Close" )
1781     end

```

Now, you can return the value we have computed.

```

1782     return lpeg
1783 end

```

The following LPEG is in relation with the key `math-comments`. It will be used in all the languages.

```

1784 local CommentMath =
1785     P "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * P "$" -- $

```

**EOL** The following LPEG will detect the Python prompts when the user is typesetting an interactive session of Python (directly or through `{pyconsole}` of `pyluatex`). We have to detect that prompt twice. The first detection (called *hasty detection*) will be before the `\@@_begin_line:` because you want to trigger a special background color for that row (and, after the `\@@_begin_line:`, it's too late to change de background).

```

1786 local PromptHastyDetection =
1787     ( # ( P "">>>>" + "..." ) * Lc '\@@_prompt:' ) ^ -1

```

We remind that the marker `#` of LPEG specifies that the pattern will be detected but won't consume any character.

With the following LPEG, a style will actually be applied to the prompt (for instance, it's possible to decide to discard these prompts).

```

1788 local Prompt = K ( 'Prompt' , ( ( P "">>>>" + "..." ) * P " " ^ -1 ) ^ -1 )

```

The following LPEG EOL is for the end of lines.

```

1789 local EOL =
1790     P "\r"
1791     *
1792     (
1793         ( space ^ 0 * -1 )
1794         +

```

We recall that each line in the Python code we have to parse will be sent back to LaTeX between a pair `\@@_begin_line:` – `\@@_end_line:`<sup>34</sup>.

---

<sup>34</sup>Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

1795 Ct (
1796   Cc "EOL"
1797   *
1798   Ct (
1799     Lc "\\@@_end_line:"
1800     * BeamerEndEnvironments
1801     * BeamerBeginEnvironments
1802     * PromptHastyDetection
1803     * Lc "\\@@_newline: \\@@_begin_line:"
1804     * Prompt
1805   )
1806 )
1807 )
1808 * ( SpaceIndentation ^ 0 * # ( 1 - S " \r" ) ) ^ -1

```

The following LPEG CommentLaTeX is for what is called in that document the “LaTeX comments”. Since the elements that will be caught must be sent to LaTeX with standard LaTeX catcodes, we put the capture (done by the function C) in a table (by using Ct, which is an alias for lpeg.Ct).

```

1809 local CommentLaTeX =
1810   P(piton.comment_latex)
1811   * Lc "{\\PitonStyle{Comment.LaTeX}{\\ignorespaces"
1812   * L ( ( 1 - P "\r" ) ^ 0 )
1813   * Lc "}"}
1814   * ( EOL + -1 )

```

### 10.3.2 The language Python

Some strings of length 2 are explicit because we want the corresponding ligatures available in some fonts such as *Fira Code* to be active.

```

1815 local Operator =
1816   K ( 'Operator' ,
1817     P "!=" + "<>" + "==" + "<<" + ">>" + "<=" + ">=" + ":" + "//" + "**"
1818     + S "-~+/*%=<>&.@|")
1819
1820 local OperatorWord =
1821   K ( 'Operator.Word' , P "in" + "is" + "and" + "or" + "not" )

```

The keyword in in a construction such as “`for i in range(n)`” must be formatted as a keyword and not as an `Operator.Word`.

```

1822 local For = K ( 'Keyword' , P "for" )
1823   * Space
1824   * Identifier
1825   * Space
1826   * K ( 'Keyword' , P "in" )

1866       "ConnectionError" + "BrokenPipeError" + "ConnectionAbortedError" +
1867       "ConnectionRefusedError" + "ConnectionResetError" + "FileExistsError" +
1868       "FileNotFoundException" + "InterruptedError" + "IsADirectoryError" +
1869       "NotADirectoryError" + "PermissionError" + "ProcessLookupError" +
1870       "TimeoutError" + "StopAsyncIteration" + "ModuleNotFoundError" +
1871       "RecursionError" )
1872
1873
1874 local RaiseException = K ( 'Keyword' , P "raise" ) * SkipSpace * Exception * Q "("
1875

```

In Python, a “decorator” is a statement whose begins by @ which patches the function defined in the following statement.

```
1876 local Decorator = K ( 'Name.Decorator' , P "@" * letter ^ 1 )
```

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style Name.Class).

Example: `class myclass:`

```
1877 local DefClass =
1878   K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )
```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG Keyword (useful if we want to type a list of keywords).

The following LPEG ImportAs is used for the lines beginning by `import`. We have to detect the potential keyword `as` because both the name of the module and its alias must be formatted with the piton style Name.Namespace.

Example: `import numpy as np`

Moreover, after the keyword `import`, it's possible to have a comma-separated list of modules (if the keyword `as` is not used).

Example: `import math, numpy`

```
1879 local ImportAs =
1880   K ( 'Keyword' , "import" )
1881   * Space
1882   * K ( 'Name.Namespace' , identifier * ( "." * identifier ) ^ 0 )
1883   * (
1884     ( Space * K ( 'Keyword' , "as" ) * Space
1885       * K ( 'Name.Namespace' , identifier ) )
```

```

1886     +
1887     ( SkipSpace * Q "," * SkipSpace
1888         * K ( 'Name.Namespace' , identifier ) ) ^ 0
1889 )

```

Be careful: there is no commutativity of + in the previous expression.

The LPEG `FromImport` is used for the lines beginning by `from`. We need a special treatment because the identifier following the keyword `from` must be formatted with the `piton` style `Name.Namespace` and the following keyword `import` must be formatted with the `piton` style `Keyword` and must *not* be caught by the LPEG `ImportAs`.

Example: `from math import pi`

```

1890 local FromImport =
1891     K ( 'Keyword' , "from" )
1892     * Space * K ( 'Name.Namespace' , identifier )
1893     * Space * K ( 'Keyword' , "import" )

```

**The strings of Python** For the strings in Python, there are four categories of delimiters (without counting the prefixes for f-strings and raw strings). We will use, in the names of our LPEG, prefixes to distinguish the LPEG dealing with that categories of strings, as presented in the following tabular.

	Single	Double
Short	'text'	"text"
Long	'''test'''	"""text"""

We have also to deal with the interpolations in the f-strings. Here is an example of a f-string with an interpolation and a format instruction<sup>35</sup> in that interpolation:

```
f'Total price: {total:+.2f} €'
```

The interpolations beginning by % (even though there is more modern techniques now in Python).

```

1894 local PercentInterpol =
1895     K ( 'String.Interpol' ,
1896         P "%"
1897         * ( "(" * alphanum ^ 1 * ")" ) ^ -1
1898         * ( S "-#0 +" ) ^ 0
1899         * ( digit ^ 1 + "*" ) ^ -1
1900         * ( "." * ( digit ^ 1 + "*" ) ) ^ -1
1901         * ( S "HLL" ) ^ -1
1902         * S "sdfFeExXorgiGauc%"
1903 )

```

We can now define the LPEG for the four kinds of strings. It's not possible to use our function `K` because of the interpolations which must be formatted with another `piton` style that the rest of the string.<sup>36</sup>

```

1904 local SingleShortString =
1905     WithStyle ( 'String.Short' ,

```

First, we deal with the f-strings of Python, which are prefixed by `f` or `F`.

```

1906     Q ( P "f'" + "F'" )
1907     *
1908     K ( 'String.Interpol' , "{}" )
1909     * K ( 'Interpol.Inside' , ( 1 - S "}:;" ) ^ 0 )

```

<sup>35</sup>There is no special `piton` style for the formatting instruction (after the colon): the style which will be applied will be the style of the encompassing string, that is to say `String.Short` or `String.Long`.

<sup>36</sup>The interpolations are formatted with the `piton` style `Interpol.Inside`. The initial value of that style is `\@_piton:n` which means that the interpolations are parsed once again by `piton`.

```

1910      * Q ( P ":" * ( 1 - S "}:'" ) ^ 0 ) ^ -1
1911      * K ( 'String.Interpol' , "}" )
1912      +
1913      VisualSpace
1914      +
1915      Q ( ( P "\\" + "{}" + "}" ) ^ 1 - S " {}'" ) ^ 1 )
1916      ) ^ 0
1917      * Q """
1918      +

```

Now, we deal with the standard strings of Python, but also the “raw strings”.

```

1919      Q ( P "" + "r'" + "R'" )
1920      * ( Q ( ( P "\\" + 1 - S " '\r%" ) ^ 1 )
1921          + VisualSpace
1922          + PercentInterpol
1923          + Q "%"
1924          ) ^ 0
1925          * Q """
1926
1927
1928
1929 local DoubleShortString =
1930   WithStyle ( 'String.Short' ,
1931     Q ( P "f\\"" + "F\\"" )
1932     * (
1933       K ( 'String.Interpol' , "{}" )
1934       * K ( 'Interpol.Inside' , ( 1 - S "}\":'" ) ^ 0 )
1935       * ( K ( 'String.Interpol' , ":" ) * Q ( (1 - S "}:\\" ) ^ 0 ) ) ^ -1
1936       * K ( 'String.Interpol' , "}" )
1937       +
1938       VisualSpace
1939       +
1940       Q ( ( P "\\\\" + "{}" + "}" ) ^ 1 - S " {}\"'" ) ^ 1 )
1941       ) ^ 0
1942       * Q "\\""
1943     +
1944     Q ( P "\\"" + "r\\"" + "R\\"" )
1945     * ( Q ( ( P "\\\\" + 1 - S " '\r%" ) ^ 1 )
1946         + VisualSpace
1947         + PercentInterpol
1948         + Q "%"
1949         ) ^ 0
1950         * Q "\\""
1951
1952 local ShortString = SingleShortString + DoubleShortString

```

## Beamer

```

1953 local braces =
1954   Compute_braces
1955   (
1956     Q ( P "\\"" + "r\\"" + "R\\"" + "f\\"" + "F\\"" )
1957     * ( "\\" * ( P "\\\\" + 1 - S "\\" ) ^ 0 * "\\" )
1958   +
1959     Q ( P '\'' + 'r\'' + 'R\'' + 'f\'' + 'F\'' )
1960     * ( '\'' * ( P '\\\\' + 1 - S '\'' ) ^ 0 * '\'' )
1961   )
1962 if piton.beamer then Beamer = Compute_Beamer ( 'python' , braces ) end

```

## Detected commands

```

1963 DetectedCommands = Compute_DetectedCommands ( 'python' , braces )

```

## LPEG\_cleaner

```
1964 LPEG_cleaner['python'] = Compute_LPEG_cleaner ( 'python' , braces )
```

### The long strings

```
1965 local SingleLongString =
1966   WithStyle ( 'String.Long' ,
1967     ( Q ( S "fF" * P "****" )
1968       *
1969         K ( 'String.Interpol' , "{}" )
1970         * K ( 'Interpol.Inside' , ( 1 - S "}:\r" - "****" ) ^ 0 )
1971         * Q ( P ":" * (1 - S "}:\r" - "****" ) ^ 0 ) ^ -1
1972         * K ( 'String.Interpol' , "}" )
1973         +
1974         Q ( ( 1 - P "****" - S "{}'\r" ) ^ 1 )
1975         +
1976         EOL
1977       ) ^ 0
1978     +
1979     Q ( ( S "rR" ) ^ -1 * "****" )
1980   *
1981     Q ( ( 1 - P "****" - S "\r%" ) ^ 1 )
1982     +
1983     PercentInterpol
1984     +
1985     P "%"
1986     +
1987     EOL
1988   ) ^ 0
1989 )
1990 * Q "****" )
1991
1992
1993 local DoubleLongString =
1994   WithStyle ( 'String.Long' ,
1995   (
1996     Q ( S "fF" * "\\" \\
1997     *
1998       K ( 'String.Interpol' , "{}" )
1999       * K ( 'Interpol.Inside' , ( 1 - S "}:\r" - "\\" \\
2000         * Q ( ":" * (1 - S "}:\r" - "\\" \\
2001         * K ( 'String.Interpol' , "}" )
2002         +
2003         Q ( ( 1 - S "{}'\r" - "\\" \\
2004         +
2005         EOL
2006       ) ^ 0
2007     +
2008     Q ( S "rR" ^ -1 * "\\" \\
2009     *
2010       Q ( ( 1 - P "\\" \\
2011         +
2012       PercentInterpol
2013         +
2014       P "%"
2015         +
2016       EOL
2017     ) ^ 0
2018   )
2019   * Q "\\" \\
2020   )
2021 local LongString = SingleLongString + DoubleLongString
```

We have a LPEG for the Python docstrings. That LPEG will be used in the LPEG `DefFunction` which deals with the whole preamble of a function definition (which begins with `def`).

```
2022 local StringDoc =
2023   K ( 'String.Doc' , P "r" ^ -1 * "\\" )
2024   * ( K ( 'String.Doc' , (1 - P "\\" ) ^ 0 ) * EOL
2025     * Tab ^ 0
2026   ) ^ 0
2027   * K ( 'String.Doc' , ( 1 - P "\\" ) ^ 0 * "\\" )
```

**The comments in the Python listings** We define different LPEG dealing with comments in the Python listings.

```
2028 local Comment =
2029   WithStyle ( 'Comment' ,
2030     Q "#" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
2031     * ( EOL + -1 )
```

**DefFunction** The following LPEG expression will be used for the parameters in the `argspec` of a Python function. It's necessary to use a *grammar* because that pattern mainly checks the correct nesting of the delimiters (and it's known in the theory of formal languages that this can't be done with regular expressions *stricto sensu* only).

```
2032 local expression =
2033   P { "E" ,
2034     E = ( "" * ( P "\\" + 1 - S "'\r" ) ^ 0 * "!"
2035       + "\\" * ( P "\\" + 1 - S "\\" ) ^ 0 * "\"
2036       + "{" * V "F" * "}"
2037       + "(" * V "F" * ")"
2038       + "[" * V "F" * "]"
2039       + ( 1 - S "{}()[]\r," ) ) ^ 0 ,
2040     F = ( "{" * V "F" * "}"
2041       + "(" * V "F" * ")"
2042       + "[" * V "F" * "]"
2043       + ( 1 - S "{}()[]\r\!'" ) ) ^ 0
2044 }
```

We will now define a LPEG `Params` that will catch the list of parameters (that is to say the `argspec`) in the definition of a Python function. For example, in the line of code

```
def MyFunction(a,b,x=10,n:int): return n
```

the LPEG `Params` will be used to catch the chunk `a,b,x=10,n:int`.

```
2045 local Params =
2046   P { "E" ,
2047     E = ( V "F" * ( Q "," * V "F" ) ^ 0 ) ^ -1 ,
2048     F = SkipSpace * ( Identifier + Q "*args" + Q "**kwargs" ) * SkipSpace
2049     * (
2050       K ( 'InitialValues' , "=" * expression )
2051       + Q ":" * SkipSpace * K ( 'Name.Type' , identifier )
2052     ) ^ -1
2053 }
```

The following LPEG `DefFunction` catches a keyword `def` and the following name of function *but also everything else until a potential docstring*. That's why this definition of LPEG must occur (in the file `piton.sty`) after the definition of several other LPEG such as `Comment`, `CommentLaTeX`, `Params`, `StringDoc`...

```
2054 local DefFunction =
2055   K ( 'Keyword' , "def" )
2056   * Space
```

```

2057 * K ( 'Name.Function.Internal' , identifier )
2058 * SkipSpace
2059 * Q "(" * Params * Q ")"
2060 * SkipSpace
2061 * ( Q "->" * SkipSpace * K ( 'Name.Type' , identifier ) ) ^ -1

```

Here, we need a `piton` style `ParseAgain` which will be linked to `\@_piton:n` (that means that the capture will be parsed once again by `piton`). We could avoid that kind of trick by using a non-terminal of a grammar but we have probably here a better legibility.

```

2062 * K ( 'ParseAgain.noCR' , ( 1 - S ":\\r" ) ^ 0 )
2063 * Q ":"*
2064 * ( SkipSpace
2065     * ( EOL + CommentLaTeX + Comment ) -- in all cases, that contains an EOL
2066     * Tab ^ 0
2067     * SkipSpace
2068     * StringDoc ^ 0 -- there may be additional docstrings
2069 ) ^ -1

```

Remark that, in the previous code, `CommentLaTeX` must appear before `Comment`: there is no commutativity of the addition for the *parsing expression grammars* (PEG).

If the word `def` is not followed by an identifier and parenthesis, it will be caught as keyword by the LPEG Keyword (useful if, for example, the final user wants to speak of the keyword `def`).

## Miscellaneous

```

2070 local ExceptionInConsole = Exception * Q ( ( 1 - P "\\r" ) ^ 0 ) * EOL

```

## The main LPEG for the language Python

```

2071 local EndKeyword = Space + Punct + Delim + EOL + Beamer + DetectedCommands + -1

```

First, the main loop :

```

2072 local Main =
2073     -- space ^ 1 * -1
2074     -- + space ^ 0 * EOL
2075     Space
2076     + Tab
2077     + Escape + EscapeMath
2078     + CommentLaTeX
2079     + Beamer
2080     + DetectedCommands
2081     + LongString
2082     + Comment
2083     + ExceptionInConsole
2084     + Delim
2085     + Operator
2086     + OperatorWord * EndKeyword
2087     + ShortString
2088     + Punct
2089     + FromImport
2090     + RaiseException
2091     + DefFunction
2092     + DefClass
2093     + For
2094     + Keyword * EndKeyword
2095     + Decorator
2096     + Builtin * EndKeyword
2097     + Identifier
2098     + Number
2099     + Word

```

Here, we must not put `local!`

```

2100 LPEG1['python'] = Main ^ 0

```

We recall that each line in the Python code to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`<sup>37</sup>.

```

2101 LPEG2['python'] =
2102   Ct (
2103     ( space ^ 0 * "\r" ) ^ -1
2104     * BeamerBeginEnvironments
2105     * PromptHastyDetection
2106     * Lc '\@@_begin_line:'
2107     * Prompt
2108     * SpaceIndentation ^ 0
2109     * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
2110     * -1
2111     * Lc '\@@_end_line:'
2112   )

```

### 10.3.3 The language Ocaml

```

2113 local Delim = Q ( P "[" + "[]" + S "[()]" )
2114 local Punct = Q ( S ",;:;" )

```

The identifiers caught by `cap_identifier` begin with a cap. In OCaml, it's used for the constructors of types and for the modules.

```

2115 local cap_identifier = R "AZ" * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
2116 local Constructor = K ( 'Name.Constructor' , cap_identifier )
2117 local ModuleType = K ( 'Name.Type' , cap_identifier )

```

The identifiers which begin with a lower case letter or an underscore are used elsewhere in OCaml.

```

2118 local identifier = ( R "az" + "_" ) * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
2119 local Identifier = K ( 'Identifier' , identifier )

```

Now, we deal with the records because we want to catch the names of the fields of those records in all circumstances.

```

2120 local expression_for_fields =
2121   P { "E" ,
2122     E = (   "{" * V "F" * "}"
2123           + "(" * V "F" * ")"
2124           + "[" * V "F" * "]"
2125           + "\\" * ( P "\\\\" + 1 - S "\r" ) ^ 0 * "\\" "
2126           + '"' * ( P "\'" + 1 - S "'\r" ) ^ 0 * "'"
2127           + ( 1 - S "{}()[]\r;" ) ) ^ 0 ,
2128     F = (   "{" * V "F" * "}"
2129           + "(" * V "F" * ")"
2130           + "[" * V "F" * "]"
2131           + ( 1 - S "{}()[]\r\"'" ) ) ^ 0
2132   }
2133 local OneFieldDefinition =
2134   ( K ( 'Keyword' , "mutable" ) * SkipSpace ) ^ -1
2135   * K ( 'Name.Field' , identifier ) * SkipSpace
2136   * Q ":" * SkipSpace
2137   * K ( 'Name.Type' , expression_for_fields )
2138   * SkipSpace
2139
2140 local OneField =
2141   K ( 'Name.Field' , identifier ) * SkipSpace
2142   * Q "=" * SkipSpace
2143   * ( expression_for_fields
2144     / ( function ( s ) return LPEG1['ocaml'] : match ( s ) end )
2145   )
2146   * SkipSpace

```

---

<sup>37</sup>Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

2147
2148 local Record =
2149   Q "{" * SkipSpace
2150   *
2151   (
2152     OneFieldDefinition * ( Q ";" * SkipSpace * OneFieldDefinition ) ^ 0
2153     +
2154     OneField * ( Q ";" * SkipSpace * OneField ) ^ 0
2155   )
2156   *
2157 Q "}"

```

Now, we deal with the notations with points (eg: `List.length`). In OCaml, such notation is used for the fields of the records and for the modules.

```

2158 local DotNotation =
2159   (
2160     K ( 'Name.Module' , cap_identifier )
2161     * Q "."
2162     * ( Identifier + Constructor + Q "(" + Q "[" + Q "{" ) ^ ( -1 )
2163     +
2164     Identifier
2165     * Q "."
2166     * K ( 'Name.Field' , identifier )
2167   )
2168   * ( Q "." * K ( 'Name.Field' , identifier ) ) ^ 0
2169 local Operator =
2170   K ( 'Operator' ,
2171     P "!=" + "<>" + "==" + "<<" + ">>" + "<=" + ">=" + ":" + "| |" + "&&" +
2172     "///" + "*" + ";" + ":" + "->" + "+" + "-" + "*." + "/"
2173     + S "--+/*%=<>&@|" )
2174
2175 local OperatorWord =
2176   K ( 'Operator.Word' ,
2177     P "and" + "asr" + "land" + "lor" + "lsl" + "lxor" + "mod" + "or" )
2178
2179 local Keyword =
2180   K ( 'Keyword' ,
2181     P "assert" + "and" + "as" + "begin" + "class" + "constraint" + "done"
2182     + "downto" + "do" + "else" + "end" + "exception" + "external" + "for" +
2183     "function" + "functor" + "fun" + "if" + "include" + "inherit" + "initializer"
2184     + "in" + "lazy" + "let" + "match" + "method" + "module" + "mutable" + "new" +
2185     "object" + "of" + "open" + "private" + "raise" + "rec" + "sig" + "struct" +
2186     "then" + "to" + "try" + "type" + "value" + "val" + "virtual" + "when" +
2187     "while" + "with" )
2188   + K ( 'Keyword.Constant' , P "true" + "false" )
2189
2190 local Builtin =
2191   K ( 'Name.Builtin' , P "not" + "incr" + "decr" + "fst" + "snd" )

```

The following exceptions are exceptions in the standard library of OCaml (Stdlib).

```

2192 local Exception =
2193   K ( 'Exception' ,
2194     P "Division_by_zero" + "End_of_File" + "Failure" + "Invalid_argument" +
2195     "Match_failure" + "Not_found" + "Out_of_memory" + "Stack_overflow" +
2196     "Sys_blocked_io" + "Sys_error" + "Undefined_recursive_module" )

```

## The characters in OCaml

```

2197 local Char =
2198   K ( 'String.Short' , '"' * ( ( 1 - P '"' ) ^ 0 + "\\\\" ) * '"' )

```

## Beamer

```

2199 braces = Compute_braces ( "\"" * ( 1 - S "\"" ) ^ 0 * "\"" )
2200 if piton.beamer then
2201   Beamer = Compute_Beamer ( 'ocaml' , braces ) -- modified 2024/07/24
2202 end
2203 DetectedCommands = Compute_DetectedCommands ( 'ocaml' , braces )

2204 LPEG_cleaner['ocaml'] = Compute_LPEG_cleaner ( 'ocaml' , braces )

```

**The strings en OCaml** We need a pattern `ocaml_string` without captures because it will be used within the comments of OCaml.

```

2205 local ocaml_string =
2206   Q "\""
2207   *
2208   (
2209     VisualSpace
2210     +
2211     Q ( ( 1 - S "\r" ) ^ 1 )
2212     +
2213     EOL
2214   ) ^ 0
2215   * Q "\""

2215 local String = WithStyle ( 'String.Long' , ocaml_string )

```

Now, the “quoted strings” of OCaml (for example `{ext|Essai|ext}`).

For those strings, we will do two consecutive analysis. First an analysis to determine the whole string and, then, an analysis for the potential visual spaces and the EOL in the string.

The first analysis require a match-time capture. For explanations about that programmation, see the paragraphe *Lua's long strings* in [www.inf.puc-rio.br/~roberto/lpeg](http://www.inf.puc-rio.br/~roberto/lpeg).

```

2216 local ext = ( R "az" + "_" ) ^ 0
2217 local open = "{" * Cg ( ext , 'init' ) * "|"
2218 local close = "|" * C ( ext ) * "}"
2219 local closeeq =
2220   Cmt ( close * Cb ( 'init' ) ,
2221         function ( s , i , a , b ) return a == b end )

```

The `LPEG_QuotedStringBis` will do the second analysis.

```

2222 local QuotedStringBis =
2223   WithStyle ( 'String.Long' ,
2224   (
2225     Space
2226     +
2227     Q ( ( 1 - S "\r" ) ^ 1 )
2228     +
2229     EOL
2230   ) ^ 0 )

```

We use a “function capture” (as called in the official documentation of the `LPEG`) in order to do the second analysis on the result of the first one.

```

2231 local QuotedString =
2232   C ( open * ( 1 - closeeq ) ^ 0 * close ) /
2233   ( function ( s ) return QuotedStringBis : match ( s ) end )

```

**The comments in the OCaml listings** In OCaml, the delimiters for the comments are (\* and \*). There are unsymmetrical and OCaml allows those comments to be nested. That's why we need a grammar.

In these comments, we embed the math comments (between \$ and \$) and we embed also a treatment for the end of lines (since the comments may be multi-lines).

```

2234 local Comment =
2235   WithStyle ( 'Comment' ,
2236     P {
2237       "A" ,
2238       A = Q "(*"
2239         * ( V "A"
2240           + Q ( ( 1 - S "\r$\\" - "(*" - "*") ) ^ 1 ) -- $
2241           + ocaml_string
2242           + $" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * $" -- $
2243           + EOL
2244           ) ^ 0
2245           * Q "*)"
2246     } )

```

## The DefFunction

```

2247 local balanced_parens =
2248   P { "E" , E = ( "(" * V "E" * ")" + 1 - S "(" ) ^ 0 }

2249 local Argument =
2250   K ( 'Identifier' , identifier )
2251   + Q "(" * SkipSpace
2252     * K ( 'Identifier' , identifier ) * SkipSpace
2253     * Q ":" * SkipSpace
2254     * K ( 'Name.Type' , balanced_parens ) * SkipSpace
2255     * Q ")"

```

Despite its name, then LPEG DefFunction deals also with let open which opens locally a module.

```

2256 local DefFunction =
2257   K ( 'Keyword' , "let open" )
2258   * Space
2259   * K ( 'Name.Module' , cap_identifier )
2260   +
2261   K ( 'Keyword' , P "let rec" + "let" + "and" )
2262   * Space
2263   * K ( 'Name.Function.Internal' , identifier )
2264   * Space
2265   * (
2266     Q "=" * SkipSpace * K ( 'Keyword' , "function" )
2267     +
2268     Argument
2269     * ( SkipSpace * Argument ) ^ 0
2270     * (
2271       SkipSpace
2272       * Q ";"
2273       * K ( 'Name.Type' , ( 1 - P "=" ) ^ 0 )
2274     ) ^ -1
2275   )

```

**The DefModule** The following LPEG will be used in the definitions of modules but also in the definitions of *types* of modules.

```

2276 local DefModule =
2277   K ( 'Keyword' , "module" ) * Space
2278   *
2279   (

```

```

2280      K ( 'Keyword' , "type" ) * Space
2281      * K ( 'Name.Type' , cap_identifier )
2282      +
2283      K ( 'Name.Module' , cap_identifier ) * SkipSpace
2284      *
2285      (
2286      Q "(" * SkipSpace
2287      * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2288      * Q ":" * SkipSpace
2289      * K ( 'Name.Type' , cap_identifier ) * SkipSpace
2290      *
2291      (
2292      Q "," * SkipSpace
2293      * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2294      * Q ":" * SkipSpace
2295      * K ( 'Name.Type' , cap_identifier ) * SkipSpace
2296      ) ^ 0
2297      * Q ")"
2298      ) ^ -1
2299      *
2300      (
2301      Q "=" * SkipSpace
2302      * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2303      * Q "("
2304      * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2305      *
2306      (
2307      Q ","
2308      *
2309      K ( 'Name.Module' , cap_identifier ) * SkipSpace
2310      ) ^ 0
2311      * Q ")"
2312      ) ^ -1
2313      )
2314      +
2315      K ( 'Keyword' , P "include" + "open" )
2316      * Space * K ( 'Name.Module' , cap_identifier )

```

## The parameters of the types

```
2317 local TypeParameter = K ( 'TypeParameter' , """ * alpha * # ( 1 - P """ ) )
```

## The main LPEG for the language OCaml

```
2318 local EndKeyword = Space + Punct + Delim + EOL + Beamer + DetectedCommands + -1
```

First, the main loop :

```

2319 local Main =
2320     Space
2321     + Tab
2322     + Escape + EscapeMath
2323     + Beamer
2324     + DetectedCommands
2325     + TypeParameter
2326     + String + QuotedString + Char
2327     + Comment
2328     + Delim
2329     + Operator
2330     + Punct
2331     + FromImport
2332     + Exception
2333     + DefFunction

```

```

2334     + DefModule
2335     + Record
2336     + Keyword * EndKeyword
2337     + OperatorWord * EndKeyword
2338     + Builtin * EndKeyword
2339     + DotNotation
2340     + Constructor
2341     + Identifier
2342     + Number
2343     + Word
2344
2345 LPEG1['ocaml'] = Main ^ 0

```

We recall that each line in the code to parse will be sent back to LaTeX between a pair `\@@_begin_line:` – `\@@_end_line:`<sup>38</sup>.

```

2346 LPEG2['ocaml'] =
2347   Ct (
2348     ( space ^ 0 * "\r" ) ^ -1
2349     * BeamerBeginEnvironments
2350     * Lc '\@@_begin_line:'
2351     * SpaceIndentation ^ 0
2352     * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
2353     * -1
2354     * Lc '\@@_end_line:'
2355   )

```

#### 10.3.4 The language C

```

2356 local Delim = Q ( S "{[()]}")
2357 local Punct = Q ( S ",::;!" )

```

Some strings of length 2 are explicit because we want the corresponding ligatures available in some fonts such as *Fira Code* to be active.

```

2358 local identifier = letter * alphanum ^ 0
2359
2360 local Operator =
2361   K ( 'Operator' ,
2362     P "!=" + "==" + "<<" + ">>" + "<=" + ">=" + "||" + "&&"
2363     + S "--+/*%=>&.@|!" )
2364
2365 local Keyword =
2366   K ( 'Keyword' ,
2367     P "alignas" + "asm" + "auto" + "break" + "case" + "catch" + "class" +
2368     "const" + "constexpr" + "continue" + "decltype" + "do" + "else" + "enum" +
2369     "extern" + "for" + "goto" + "if" + "nexcept" + "private" + "public" +
2370     "register" + "restricted" + "return" + "static" + "static_assert" +
2371     "struct" + "switch" + "thread_local" + "throw" + "try" + "typedef" +
2372     "union" + "using" + "virtual" + "volatile" + "while"
2373   )
2374   + K ( 'Keyword.Constant' , P "default" + "false" + "NULL" + "nullptr" + "true" )
2375
2376 local Builtin =
2377   K ( 'Name.Builtin' ,
2378     P "alignof" + "malloc" + "printf" + "scanf" + "sizeof" )
2379
2380 local Type =
2381   K ( 'Name.Type' ,

```

---

<sup>38</sup>Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

2382     P "bool" + "char" + "char16_t" + "char32_t" + "double" + "float" + "int" +
2383     "int8_t" + "int16_t" + "int32_t" + "int64_t" + "long" + "short" + "signed"
2384     + "unsigned" + "void" + "wchar_t" ) * Q "*" ^ 0
2385
2386 local DefFunction =
2387   Type
2388   * Space
2389   * Q "*" ^ -1
2390   * K ( 'Name.Function.Internal' , identifier )
2391   * SkipSpace
2392   * # P "("

```

We remind that the marker # of LPEG specifies that the pattern will be detected but won't consume any character.

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style `Name.Class`).

Example: `class myclass:`

```

2393 local DefClass =
2394   K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )

```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG `Keyword` (useful if we want to type a list of keywords).

## The strings of C

```

2395 String =
2396   WithStyle ( 'String.Long' ,
2397     Q "\""
2398   * ( VisualSpace
2399     + K ( 'String.Interpol' ,
2400       "%" * ( S "difcspxXou" + "ld" + "li" + "hd" + "hi" )
2401       )
2402     + Q ( ( P "\\\\" + 1 - S " \"\\"" ) ^ 1 )
2403   ) ^ 0
2404   * Q "\""
2405 )

```

## Beamer

```

2406 braces = Compute_braces ( "\"" * ( 1 - S "\"" ) ^ 0 * "\"" )
2407 if piton.beamer then Beamer = Compute_Beamer ( 'c' , braces ) end
2408 DetectedCommands = Compute_DetectedCommands ( 'c' , braces )
2409 LPEG_cleaner['c'] = Compute_LPEG_cleaner ( 'c' , braces )

```

## The directives of the preprocessor

```

2410 local Preproc = K ( 'Preproc' , "#" * ( 1 - P "\r" ) ^ 0 ) * ( EOL + -1 )

```

**The comments in the C listings** We define different LPEG dealing with comments in the C listings.

```

2411 local Comment =
2412   WithStyle ( 'Comment' ,
2413     Q("//" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
2414     * ( EOL + -1 )
2415
2416 local LongComment =
2417   WithStyle ( 'Comment' ,
2418     Q "/*"

```

```

2419     * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
2420     * Q "*/"
2421 ) -- $

```

### The main LPEG for the language C

```
2422 local EndKeyword = Space + Punct + Delim + EOL + Beamer + DetectedCommands + -1
```

First, the main loop :

```

2423 local Main =
2424     Space
2425     + Tab
2426     + Escape + EscapeMath
2427     + CommentLaTeX
2428     + Beamer
2429     + DetectedCommands
2430     + Preproc
2431     + Comment + LongComment
2432     + Delim
2433     + Operator
2434     + String
2435     + Punct
2436     + DefFunction
2437     + DefClass
2438     + Type * ( Q "*" ^ -1 + EndKeyword )
2439     + Keyword * EndKeyword
2440     + Builtin * EndKeyword
2441     + Identifier
2442     + Number
2443     + Word

```

Here, we must not put local!

```
2444 LPEG1['c'] = Main ^ 0
```

We recall that each line in the C code to parse will be sent back to LaTeX between a pair \@@\_begin\_line: – \@@\_end\_line:<sup>39</sup>.

```

2445 LPEG2['c'] =
2446     Ct (
2447         ( space ^ 0 * P "\r" ) ^ -1
2448         * BeamerBeginEnvironments
2449         * Lc '\@@_begin_line:'
2450         * SpaceIndentation ^ 0
2451         * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
2452         * -1
2453         * Lc '\@@_end_line:'
2454     )

```

### 10.3.5 The language SQL

```

2455 local function LuaKeyword ( name )
2456     return
2457     Lc [[{\PitonStyle{Keyword}[]}]]
2458     * Q ( Cmt (
2459         C ( identifier ) ,
2460         function ( s , i , a ) return string.upper ( a ) == name end
2461     )
2462     )
2463     * Lc "}"

```

---

<sup>39</sup>Remember that the \@@\_end\_line: must be explicit because it will be used as marker in order to delimit the argument of the command \@@\_begin\_line:

```
2464 end
```

In the identifiers, we will be able to catch those containing spaces, that is to say like "last name".

```
2465 local identifier =
2466   letter * ( alphanum + "-" ) ^ 0
2467   + "'" * ( ( alphanum + space - "'" ) ^ 1 ) * "'"
2468
2469
2470 local Operator =
2471   K ( 'Operator' , P "=" + "!=" + "<>" + ">=" + ">" + "<=" + "<" + S "*+/" )
```

In SQL, the keywords are case-insensitive. That's why we have a little complication. We will catch the keywords with the identifiers and, then, distinguish the keywords with a Lua function. However, some keywords will be caught in special LPEG because we want to detect the names of the SQL tables.

```
2472 local function Set ( list )
2473   local set = { }
2474   for _, l in ipairs ( list ) do set[l] = true end
2475   return set
2476 end
2477
2478 local set_keywords = Set
2479 {
2480   "ADD" , "AFTER" , "ALL" , "ALTER" , "AND" , "AS" , "ASC" , "BETWEEN" , "BY" ,
2481   "CHANGE" , "COLUMN" , "CREATE" , "CROSS JOIN" , "DELETE" , "DESC" , "DISTINCT" ,
2482   "DROP" , "FROM" , "GROUP" , "HAVING" , "IN" , "INNER" , "INSERT" , "INTO" , "IS" ,
2483   "JOIN" , "LEFT" , "LIKE" , "LIMIT" , "MERGE" , "NOT" , "NULL" , "ON" , "OR" ,
2484   "ORDER" , "OVER" , "RIGHT" , "SELECT" , "SET" , "TABLE" , "THEN" , "TRUNCATE" ,
2485   "UNION" , "UPDATE" , "VALUES" , "WHEN" , "WHERE" , "WITH"
2486 }
2487
2488 local set_builtins = Set
2489 {
2490   "AVG" , "COUNT" , "CHAR_LENGTH" , "CONCAT" , "CURDATE" , "CURRENT_DATE" ,

2492   "RANK" , "ROUND" , "RTRIM" , "SUBSTRING" , "SUM" , "UPPER" , "YEAR"
2493 }
```

The LPEG Identifier will catch the identifiers of the fields but also the keywords and the built-in functions of SQL. It will *not* catch the names of the SQL tables.

```
2494 local Identifier =
2495   C ( identifier ) /
2496   (
2497     function (s)
2498       if set_keywords[string.upper(s)] -- the keywords are case-insensitive in SQL
```

Remind that, in Lua, it's possible to return *several* values.

```
2499     then return { "{\\PitonStyle{Keyword}{}}",
2500                   { luatexbase.catcodetables.other , s } ,
2501                   { "}" } }
2502     else if set_builtins[string.upper(s)]
2503       then return { "{\\PitonStyle{Name.Builtin}{}}",

2507                   { luatexbase.catcodetables.other , s } ,
2508                   { "}" } }
2509     end
2510   end
2511 end
2512 )
```

## The strings of SQL

```
2513 local String = K ( 'String.Long' , "" * ( 1 - P "" ) ^ 1 * "" )
```

## Beamer

```
2514 braces = Compute_braces ( String )
2515 if piton.beamer then Beamer = Compute_Beamer ( 'sql' , braces ) end
2516 DetectedCommands = Compute_DetectedCommands ( 'sql' , braces )
2517 LPEG_cleaner['sql'] = Compute_LPEG_cleaner ( 'sql' , braces )
```

**The comments in the SQL listings** We define different LPEG dealing with comments in the SQL listings.

```
2518 local Comment =
2519     WithStyle ( 'Comment' ,
2520         Q "--" -- syntax of SQL92
2521         * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
2522         * ( EOL + -1 )
2523
2524 local LongComment =
2525     WithStyle ( 'Comment' ,
2526         Q "/*"
2527         * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
2528         * Q "*/"
2529     ) -- $
```

## The main LPEG for the language SQL

```
2530 local EndKeyword = Space + Punct + Delim + EOL + Beamer + DetectedCommands + -1
2531 local TableField =
2532     K ( 'Name.Table' , identifier )
2533     * Q "."
2534     * K ( 'Name.Field' , identifier )
2535
2536 local OneField =
2537     (
2538         Q ( "(" * ( 1 - P ")" ) ^ 0 * ")" )
2539         +
2540         K ( 'Name.Table' , identifier )
2541         * Q "."
2542         * K ( 'Name.Field' , identifier )
2543         +
2544         K ( 'Name.Field' , identifier )
2545     )
2546     *
2547     Space * LuaKeyword "AS" * Space * K ( 'Name.Field' , identifier )
2548     ) ^ -1
2549     * ( Space * ( LuaKeyword "ASC" + LuaKeyword "DESC" ) ) ^ -1
2550
2551 local OneTable =
2552     K ( 'Name.Table' , identifier )

2656 % \bigskip
2657 % \subsubsection{The function Parse}
2658 %
2659 % \medskip
2660 % The function |Parse| is the main function of the package \pkg{piton}. It
2661 % parses its argument and sends back to LaTeX the code with interlaced
2662 % formatting LaTeX instructions. In fact, everything is done by the
2663 % \textsc{lpeg} corresponding to the considered language (|LPEG2[language]|)
2664 % which returns as capture a Lua table containing data to send to LaTeX.
2665 %
2666 % \bigskip
2667 % \begin{macrocode}
2668 function piton.Parse ( language , code )
2669     local t = LPEG2[language] : match ( code )
2670     if t == nil
2671     then
2672         sprintL3 [[ \@@_error_or_warning:n { syntax~error } ]]
2673         return -- to exit in force the function
2674     end
2675     local left_stack = {}
2676     local right_stack = {}
2677     for _ , one_item in ipairs ( t ) do

```

```

2678     if one_item[1] == "EOL" then
2679         for _, s in ipairs ( right_stack ) do
2680             tex.sprint ( s )
2681         end
2682         for _, s in ipairs ( one_item[2] ) do
2683             tex.tprint ( s )
2684         end
2685         for _, s in ipairs ( left_stack ) do
2686             tex.sprint ( s )
2687         end
2688     else

```

Here is an example of an item beginning with "Open".

```
{ "Open" , "\begin{uncover}{2}" , "\end{uncover}" }
```

In order to deal with the ends of lines, we have to close the environment (`\begin{uncover}` in this example) at the end of each line and reopen it at the beginning of the new line. That's why we use two Lua stacks, called `left_stack` and `right_stack`. `left_stack` will be for the elements like `\begin{uncover}{2}` and `right_stack` will be for the elements like `\end{uncover}`.

```

2689     if one_item[1] == "Open" then
2690         tex.sprint( one_item[2] )
2691         table.insert ( left_stack , one_item[2] )
2692         table.insert ( right_stack , one_item[3] )
2693     else
2694         if one_item[1] == "Close" then
2695             tex.sprint ( right_stack[#right_stack] )
2696             left_stack[#left_stack] = nil
2697             right_stack[#right_stack] = nil
2698         else
2699             tex.tprint ( one_item )
2700         end
2701     end
2702   end
2703 end
2704 end

```

The function `ParseFile` will be used by the LaTeX command `\PitonInputfile`. That function merely reads the file (between `first_line` and `last_line`) and then apply the function `Parse` to the resulting Lua string.

```

2705 function piton.ParseFile ( language , name , first_line , last_line , split )
2706   local s = ''
2707   local i = 0
2708   for line in io.lines ( name ) do
2709     i = i + 1
2710     if i >= first_line then
2711       s = s .. '\r' .. line
2712     end
2713     if i >= last_line then break end
2714   end

```

We extract the BOM of utf-8, if present.

```

2715   if string.byte ( s , 1 ) == 13 then
2716     if string.byte ( s , 2 ) == 239 then
2717       if string.byte ( s , 3 ) == 187 then
2718         if string.byte ( s , 4 ) == 191 then
2719           s = string.sub ( s , 5 , -1 )
2720         end
2721       end
2722     end
2723   end
2724   if split == 1 then
2725     piton.GobbleSplitParse ( language , 0 , s )
2726   else
2727     sprintL3 [[ \bool_if:NT \g_@@_footnote_bool \savenotes \vtop \bgroup ]]
2728     piton.Parse ( language , s )

```

```

2729     sprintL3
2730     [[\vspace{2.5pt}\egroup\bool_if:NT\g_@@_footnote_bool\endsavenotes\par]]
2731   end
2732 end

```

### 10.3.7 Two variants of the function Parse with integrated preprocessors

The following command will be used by the user command `\piton`. For that command, we have to undo the duplication of the symbols `#`.

```

2733 function piton.ParseBis ( lang , code )
2734   local s = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( code )
2735   return piton.Parse ( lang , s )
2736 end

```

The following command will be used when we have to parse some small chunks of code that have yet been parsed. They are re-scanned by LaTeX because it has been required by `\@@_piton:n` in the `piton` style of the syntactic element. In that case, you have to remove the potential `\@@_breakable_space:` that have been inserted when the key `break-lines` is in force.

```
2737 function piton.ParseTer ( lang , code )
```

Be careful: we have to write `[[\@@_breakable_space: ]]` with a space after the name of the LaTeX command `\@@_breakable_space:`

```

2738   local s = ( Cs ( ( P [[\@@_breakable_space: ]] / ' ' + 1 ) ^ 0 ) )
2739           : match ( code )
2740   return piton.Parse ( lang , s )
2741 end

```

### 10.3.8 Preprocessors of the function Parse for gobble

We deal now with preprocessors of the function `Parse` which are needed when the “gobble mechanism” is used.

The following LPEG returns as capture the minimal number of spaces at the beginning of the lines of code.

```

2742 local AutoGobbleLPEG =
2743   (
2744     P " " ^ 0 * "\r"
2745     +
2746     Ct ( C " " ^ 0 ) / table.getn
2747     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 * "\r"
2748   ) ^ 0
2749   * ( Ct ( C " " ^ 0 ) / table.getn
2750     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
2751 ) / math.min

```

The following LPEG is similar but works with the tabulations.

```

2752 local TabsAutoGobbleLPEG =
2753   (
2754     (
2755       P "\t" ^ 0 * "\r"
2756       +
2757       Ct ( C "\t" ^ 0 ) / table.getn
2758       * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 * "\r"
2759     ) ^ 0
2760     * ( Ct ( C "\t" ^ 0 ) / table.getn
2761       * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
2762   ) / math.min

```

The following LPEG returns as capture the number of spaces at the last line, that is to say before the `\end{Piton}` (and usually it's also the number of spaces before the corresponding `\begin{Piton}` because that's the traditional way to indent in LaTeX).

```

2763 local EnvGobbleLPEG =
2764   ( ( 1 - P "\r" ) ^ 0 * "\r" ) ^ 0
2765   * Ct ( C " " ^ 0 * -1 ) / table.getn
2766 local function remove_before_cr ( input_string )
2767   local match_result = ( P "\r" ) : match ( input_string )
2768   if match_result then
2769     return string.sub ( input_string , match_result )
2770   else
2771     return input_string
2772   end
2773 end

```

The function `gobble` gobbles  $n$  characters on the left of the code. The negative values of  $n$  have special significations.

```

2774 local function gobble ( n , code )
2775   code = remove_before_cr ( code )
2776   if n == 0 then
2777     return code
2778   else
2779     if n == -1 then
2780       n = AutoGobbleLPEG : match ( code )
2781     else
2782       if n == -2 then
2783         n = EnvGobbleLPEG : match ( code )
2784       else
2785         if n == -3 then
2786           n = TabsAutoGobbleLPEG : match ( code )
2787         end
2788       end
2789     end

```

We have a second test `if n == 0` because the, even if the key like `auto-gobble` is in force, it's possible that, in fact, there is no space to gobble...

```

2790   if n == 0 then
2791     return code
2792   else

```

We will now use a LPEG that we have to compute dynamically because it depends on the value of  $n$ .

```

2793   return
2794   ( Ct (
2795     ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
2796     * ( C "\r" * ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
2797     ) ^ 0 )
2798     / table.concat
2799   ) : match ( code )
2800 end
2801 end
2802 end

```

In the following code,  $n$  is the value of `\l_@@_gobble_int`.

```

2803 function piton.GobbleParse ( lang , n , code )
2804   piton.last_code = gobble ( n , code )
2805   piton.last_language = lang
2806   sprintL3 [[ \bool_if:NT \g_@@_footnote_bool \savenotes \vtop \bgroup ]]
2807   piton.Parse ( lang , piton.last_code )
2808   sprintL3
2809   [[\vspace{2.5pt}\egroup\bool_if:NT\g_@@_footnote_bool\endsavenotes\par]]

```

Now, if the final user has used the key `write` to write the code of the environment on an external file.

```
2810  if piton.write and piton.write ~= '' then
2811      local file = assert ( io.open ( piton.write , piton.write_mode ) )
2812      file:write ( piton.get_last_code ( ) )
2813      file:close ( )
2814  end
2815 end
```

The following function will be used when the key `split-on-empty-lines` is in force. With that key, the informatic code is split in chunks at the empty lines (usually between the informatic functions defined in the informatic code). LaTeX will be able to change the page between the chunks.

```
2816 function piton.GobbleSplitParse ( lang , n , code )
2817     P { "E" ,
2818         E = ( V "F"
2819             * ( P " " ^ 0 * "\r"
2820                 / ( function ( x ) sprintL3 [[ \@@_incr_visual_line: ]] end )
2821                 ) ^ 1
2822                 / ( function ( x )
2823                     sprintL3 [[ \l_@@_split_separation_t1 \int_gzero:N \g_@@_line_int ]]
2824                     end )
2825             ) ^ 0 * V "F" ,
2826         F = C ( V "G" ^ 0 )
```

The non-terminal `F` corresponds to a chunk of the informatic code.

```
2827     / ( function ( x ) piton.GobbleParse ( lang , 0 , x ) end ) ,
```

The second argument of `.pitonGobbleParse` is the argument `gobble`: we put that argument to 0 because we will have gobbled previously the whole argument `code` (see below).

```
2828     G = ( 1 - P "\r" ) ^ 0 * "\r" - ( P " " ^ 0 * "\r" )
```

```
2829 } : match ( gobble ( n , code ) )
```

```
2830 end
```

The following public Lua function is provided to the developer.

```
2831 function piton.get_last_code ( )
2832     return LPEG_cleaner[piton.last_language] : match ( piton.last_code )
2833 end
```

### 10.3.9 To count the number of lines

```
2834 function piton.CountLines ( code )
2835     local count = 0
2836     for i in code : gmatch ( "\r" ) do count = count + 1 end
2837     sprintL3 ( [[ \int_set:Nn \l_@@_nb_lines_int { }] .. count .. '}' )
2838 end

2839 function piton.CountNonEmptyLines ( code )
2840     local count = 0
2841     count =
2842         ( Ct ( ( P " " ^ 0 * "\r"
2843                 + ( 1 - P "\r" ) ^ 0 * C "\r" ) ^ 0
2844                 * ( 1 - P "\r" ) ^ 0
2845                 * -1
2846                 ) / table.getn
2847             ) : match ( code )
2848     sprintL3 ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { }] .. count .. '}' )
2849 end

2850 function piton.CountLinesFile ( name )
```

```

2851 local count = 0
2852 for line in io.lines ( name ) do count = count + 1 end
2853 sprintL3 ( [[ \int_set:Nn \l_@@_nb_lines_int { } ] .. count .. '}' )
2854 end

2855 function piton.CountNonEmptyLinesFile ( name )
2856 local count = 0
2857 for line in io.lines ( name )
2858 do if not ( ( P " " ^ 0 * -1 ) : match ( line ) ) then
2859 count = count + 1
2860 end
2861 end
2862 sprintL3 ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { } ] .. count .. '}' )
2863 end

```

The following function stores in `\l_@@_first_line_int` and `\l_@@_last_line_int` the numbers of lines of the file `file_name` corresponding to the strings `marker_beginning` and `marker_end`.

```

2864 function piton.ComputeRange(marker_beginning,marker_end,file_name)
2865 local s = ( Cs ( ( P '# #' / '#' + 1 ) ^ 0 ) ) : match ( marker_beginning )
2866 local t = ( Cs ( ( P '# #' / '#' + 1 ) ^ 0 ) ) : match ( marker_end )
2867 local first_line = -1
2868 local count = 0
2869 local last_found = false
2870 for line in io.lines ( file_name )
2871 do if first_line == -1
2872 then if string.sub ( line , 1 , #s ) == s
2873 then first_line = count
2874 end
2875 else if string.sub ( line , 1 , #t ) == t
2876 then last_found = true
2877 break
2878 end
2879 end
2880 count = count + 1
2881 end
2882 if first_line == -1
2883 then sprintL3 [[ \@@_error_or_warning:n { begin~marker~not~found } ]]
2884 else if last_found == false

2890 .. [[ \int_set:Nn \l_@@_last_line_int { } ] .. count .. ' ' ])
2891 end

```

### 10.3.10 To create new languages with the syntax of listings

```

2892 function piton.new_language ( lang , definition )
2893 lang = string.lower ( lang )

2894 local alpha , digit = lpeg.alpha , lpeg.digit
2895 local extra_letters = { "@" , "_" , "$" } -- $

```

The command `add_to_letter` (triggered by the key ) don't write right away in the LPEG pattern of the letters in an intermediate `extra_letters` because we may have to retrieve letters from that "list" if there appear in a key `alsoother`.

```

2896 function add_to_letter ( c )
2897 if c ~= " " then table.insert ( extra_letters , c ) end
2898 end

```

For the digits, it's straightforward.

```

2899     function add_to_digit ( c )
2900         if c ~= " " then digit = digit + c end
2901     end

```

The main use of the key `alsoother` is, for the language LaTeX, when you have to retrieve some characters from the list of letters, in particular `\_` and `\_` (which, by default, are not allowed in the name of a control sequence in TeX).

(In the following LPEG we have a problem when we try to add `{` and `}`).

```

2902     local other = S ":_@+-*/<>!?;.:()~^=#&\\"\\\$" -- $
2903     local extra_others = { }
2904     function add_to_other ( c )
2905         if c ~= " " then

```

We will use `extra_others` to retrieve further these characters from the list of the letters.

```
2906         extra_others[c] = true

```

The LPEG pattern `other` will be used in conjunction with the key `tag` (mainly for the language HTML) for the character `/` in the closing tags `</....>`.

```

2907         other = other + P ( c )
2908     end
2909 end

```

Of course, the LPEG `strict_braces` is for balanced braces (without the question of strings of an informatic language). In fact, it *won't* be used for an informatic language (as dealt by piton) but for LaTeX instructions;

```

2910     local strict_braces =
2911     P { "E" ,
2912         E = ( "{" * V "F" * "}" + ( 1 - S ",{}" ) ) ^ 0 ,
2913         F = ( "{" * V "F" * "}" + ( 1 - S "{}" ) ) ^ 0
2914     }

```

Now, the first transformation of the definition of the language, as provided by the final user in the argument `definition` of `piton.new_language`.

```

2915     local cut_definition =
2916     P { "E" ,
2917         E = Ct ( V "F" * ( "," * V "F" ) ^ 0 ) ,
2918         F = Ct ( space ^ 0 * C ( alpha ^ 1 ) * space ^ 0
2919                     * ( "=" * space ^ 0 * C ( strict_braces ) ) ^ -1 )
2920     }
2921     local def_table = cut_definition : match ( definition )

```

The definition of the language, provided by the final user of piton is now in the Lua table `def_table`. We will use it *several times*.

The following LPEG will be used to extract arguments in the values of the keys (`morekeywords`, `morecomment`, `morestring`, etc.).

```

2922     local tex_braced_arg = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
2923     local tex_arg = tex_braced_arg + C ( 1 )
2924     local tex_option_arg = "[[" * C ( ( 1 - P "]" ) ^ 0 ) * "]]" + Cc ( nil )
2925     local args_for_tag
2926         = tex_option_arg
2927         * space ^ 0
2928         * tex_arg
2929         * space ^ 0
2930         * tex_arg
2931     local args_for_morekeywords
2932         = "[[" * C ( ( 1 - P "]" ) ^ 0 ) * "]]"
2933         * space ^ 0
2934         * tex_option_arg
2935         * space ^ 0
2936         * tex_arg
2937         * space ^ 0

```

```

2938     * ( tex_braced_arg + Cc ( nil ) )
2939 local args_for_moredelims
2940   = ( C ( P "*" ^ -2 ) + Cc ( nil ) ) * space ^ 0
2941   * args_for_morekeywords
2942 local args_for_morecomment
2943   = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
2944   * space ^ 0
2945   * tex_option_arg
2946   * space ^ 0
2947   * C ( P ( 1 ) ^ 0 * -1 )

```

We scan the definition of the language (i.e. the table `def_table`) in order to detect the potential key `sensitive`. Indeed, we have to catch that key before the treatment of the keywords of the language. We will also look for the potential keys `alsodigit`, `alsoletter` and `tag`.

```

2948 local sensitive = true
2949 local style_tag , left_tag , right_tag
2950 for _ , x in ipairs ( def_table ) do
2951   if x[1] == "sensitive" then
2952     if x[2] == nil or ( P "true" ) : match ( x[2] ) then
2953       sensitive = true
2954     else
2955       if ( P "false" + P "f" ) : match ( x[2] ) then sensitive = false end
2956     end
2957   end
2958   if x[1] == "alsodigit" then x[2] : gsub ( ".", add_to_digit ) end
2959   if x[1] == "alsoletter" then x[2] : gsub ( ".", add_to_letter ) end
2960   if x[1] == "alsoother" then x[2] : gsub ( ".", add_to_other ) end
2961   if x[1] == "tag" then
2962     style_tag , left_tag , right_tag = args_for_tag : match ( x[2] )
2963     style_tag = style_tag or {[\\PitonStyle{Tag}]}
2964   end
2965 end

```

Now, the LPEG for the numbers. Of course, it uses `digit` previously computed.

```

2966 local Number =
2967   K ( 'Number' ,
2968     ( digit ^ 1 * "." * # ( 1 - P "." ) * digit ^ 0
2969       + digit ^ 0 * "." * digit ^ 1
2970       + digit ^ 1 )
2971     * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
2972     + digit ^ 1
2973   )
2974 local string_extra_letters = ""
2975 for _ , x in ipairs ( extra_letters ) do
2976   if not ( extra_others[x] ) then
2977     string_extra_letters = string_extra_letters .. x
2978   end
2979 end
2980 local letter = alpha + S ( string_extra_letters )
2981   + P "â" + "â" + "ç" + "é" + "è" + "ê" + "ë" + "í" + "î"
2982   + "ô" + "û" + "ü" + "Â" + "Ã" + "Ç" + "É" + "È" + "Ê" + "Ë"
2983   + "ï" + "î" + "õ" + "û" + "Ü"
2984 local alphanum = letter + digit
2985 local identifier = letter * alphanum ^ 0
2986 local Identifier = K ( 'Identifier' , identifier )

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the keywords.

The following LPEG does *not* catch the optional argument between square brackets in first position.

```

2987 local split_clist =
2988   P { "E" ,
2989     E = ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1

```

```

2990         * ( P "{" ) ^ 1
2991         * Ct ( V "F" * ( "," * V "F" ) ^ 0 )
2992         * ( P "}" ) ^ 1 * space ^ 0 ,
2993     F = space ^ 0 * C ( letter * alphanum ^ 0 + other ^ 1 ) * space ^ 0
2994 }

```

The following function will be used if the keywords are not case-sensitive.

```

2995 local function keyword_to_lpeg ( name )
2996 return
2997   Q ( Cmt (
2998     C ( identifier ) ,
2999     function(s,i,a) return string.upper(a) == string.upper(name) end
3000   )
3001 )
3002 end
3003 local Keyword = P ( false )
3004 local PrefixedKeyword = P ( false )

```

Now, we actually treat all the keywords and also the key `moredirectives`.

```

3005 for _ , x in ipairs ( def_table )
3006 do if x[1] == "morekeywords"
3007   or x[1] == "otherkeywords"
3008   or x[1] == "moredirectives"
3009   or x[1] == "moretexcs"
3010 then
3011   local keywords = P ( false )
3012   local style = {[\\PitonStyle{Keyword}]}
3013   if x[1] == "moredirectives" then style = {[\\PitonStyle{Directive} ]] end
3014   style = tex_option_arg : match ( x[2] ) or style
3015   local n = tonumber ( style )
3016   if n then
3017     if n > 1 then style = {[\\PitonStyle{Keyword}]] .. style .. "}" end
3018   end
3019   for _ , word in ipairs ( split_clist : match ( x[2] ) ) do
3020     if x[1] == "moretexcs" then
3021       keywords = Q ( [[\]] .. word ) + keywords
3022     else
3023       if sensitive

```

The documentation of `lslistings` specifies that, for the key `morekeywords`, if a keyword is a prefix of another keyword, then the prefix must appear first. However, for the lpeg, it's rather the contrary. That's why, here, we add the new element *on the left*.

```

3024   then keywords = Q ( word ) + keywords
3025   else keywords = keyword_to_lpeg ( word ) + keywords
3026   end
3027 end
3028 end
3029 Keyword = Keyword +
3030   Lc ( "{" .. style .. "{" ) * keywords * Lc "}"
3031 end

```

Of course, the feature with the key `keywordsprefix` is designed for the languages TeX, LaTeX, et al. In that case, there is two kinds of keywords (= control sequences).

- those beginning with \ and a sequence of characters of catcode “letter”;
- those beginning by \ followed by one character of catcode “other”.

The following code addresses both cases. Of course, the LPEG pattern `letter` must catch only characters of catcode “letter”. That's why we have a key `alsoletter` to add new characters in that category (e.g. : when we want to format L3 code). However, the LPEG pattern is allowed to catch *more* than only the characters of catcode “other” in TeX.

```

3032 if x[1] == "keywordsprefix" then
3033   local prefix = ( ( C ( 1 - P " " ) ^ 1 ) * P " " ^ 0 ) : match ( x[2] )
3034   PrefixedKeyword = PrefixedKeyword
3035   + K ( 'Keyword' , P ( prefix ) * ( letter ^ 1 + other ) )

```

```

3036     end
3037 end

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the strings.

```

3038 local long_string = P ( false )
3039 local LongString = P (false )
3040 local central_pattern = P ( false )
3041 for _ , x in ipairs ( def_table ) do
3042   if x[1] == "morestring" then
3043     arg1 , arg2 , arg3 , arg4 = args_for_morekeywords : match ( x[2] )
3044     arg2 = arg2 or {[\\PitonStyle{String.Long}]}
3045     if arg1 ~= "s" then
3046       arg4 = arg3
3047     end
3048     central_pattern = 1 - S ( " \r" .. arg4 )
3049     if arg1 : match "b" then
3050       central_pattern = P ( [[\]] .. arg3 ) + central_pattern
3051     end

```

In fact, the specifier `d` is point-less: when it is not in force, it's still possible to double the delimiter with a correct behaviour of piton since, in that case, piton will compose *two* contiguous strings...

```

3052   if arg1 : match "d" or arg1 == "m" then
3053     central_pattern = P ( arg3 .. arg3 ) + central_pattern
3054   end
3055   if arg1 == "m"
3056     then prefix = lpeg.B ( 1 - letter - ")" - "]" )
3057   else prefix = P ( true )
3058   end

```

We can write the pattern which matches the string.

```

3059 local pattern =
3060   prefix
3061   * Q ( arg3 )
3062   * ( VisualSpace + Q ( central_pattern ^ 1 ) + EOL ) ^ 0
3063   * Q ( arg4 )

```

First, we create `long_string` because we need that LPEG in the nested comments.

```

3064 long_string = long_string + pattern
3065 LongString = LongString +
3066   Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "}" ) * Cc "{}" )
3067   * pattern
3068   * Ct ( Cc "Close" )
3069 end
3070 end
3071
3072 local braces = Compute_braces ( String )
3073 if piton.beamer then Beamer = Compute_Beamer ( lang , braces ) end
3074
3075 DetectedCommands = Compute_DetectedCommands ( lang , braces )
3076
3077 LPEG_cleaner[lang] = Compute_LPEG_cleaner ( lang , braces )

```

Now, we deal with the comments and the delims.

```

3078 local CommentDelim = P ( false )
3079
3080 for _ , x in ipairs ( def_table ) do
3081   if x[1] == "morecomment" then
3082     local arg1 , arg2 , other_args = args_for_morecomment : match ( x[2] )
3083     arg2 = arg2 or {[\\PitonStyle{Comment}]}

```

If the letter `i` is present in the first argument (eg: `morecomment = [si]{(*){}}`), then the corresponding comments are discarded.

```

3084   if arg1 : match "i" then arg2 = {[\\PitonStyle{Discard}]]} end
3085   if arg1 : match "l" then

```

```

3086 local arg3 = ( tex_braced_arg + C ( P ( 1 ) ^ 0 * -1 ) )
3087           : match ( other_args )
3088 if arg3 == [[#]] then arg3 = "#" end -- mandatory
3089 CommentDelim = CommentDelim +
3090   Ct ( Cc "Open"
3091     * Cc ( "{" .. arg2 .. "}" * Cc "}" ) )
3092     * Q ( arg3 )
3093     * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 -- $
3094   * Ct ( Cc "Close" )
3095   * ( EOL + -1 )
3096 else
3097   local arg3 , arg4 =
3098     ( tex_arg * space ^ 0 * tex_arg ) : match ( other_args )
3099 if arg1 : match "s" then
3100   CommentDelim = CommentDelim +
3101     Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "}" * Cc "}" ) )
3102     * Q ( arg3 )
3103     *
3104       CommentMath
3105       + Q ( ( 1 - P ( arg4 ) - S "$\r" ) ^ 1 ) -- $
3106       + EOL
3107       ) ^ 0
3108     * Q ( arg4 )
3109     * Ct ( Cc "Close" )
3110 end
3111 if arg1 : match "n" then
3112   CommentDelim = CommentDelim +
3113     Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "}" * Cc "}" ) )
3114     * P { "A" ,
3115       A = Q ( arg3 )
3116       *
3117         ( V "A"
3118           + Q ( ( 1 - P ( arg3 ) - P ( arg4 )
3119             - S "\r$\\" ) ^ 1 ) -- $
3120           + long_string
3121           + "$" -- $
3122             * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) -- $
3123             * "$" -- $
3124             + EOL
3125             ) ^ 0
3126           * Q ( arg4 )
3127         }
3128     * Ct ( Cc "Close" )
3129   end
3130 end

```

For the keys `moredelim`, we have to add another argument in first position, equal to `*` or `**`.

```

3131 if x[1] == "moredelim" then
3132   local arg1 , arg2 , arg3 , arg4 , arg5
3133   = args_for_moredelims : match ( x[2] )
3134   local MyFun = Q
3135   if arg1 == "*" or arg1 == "**" then
3136     MyFun = function ( x ) return K ( 'ParseAgain.noCR' , x ) end
3137   end
3138   local left_delim
3139   if arg2 : match "i" then
3140     left_delim = P ( arg4 )
3141   else
3142     left_delim = Q ( arg4 )
3143   end
3144   if arg2 : match "l" then
3145     CommentDelim = CommentDelim +
3146       Ct ( Cc "Open" * Cc ( "{" .. arg3 .. "}" * Cc "}" ) )
3147       * left_delim

```

```

3148          * ( MyFun ( ( 1 - P "\r" ) ^ 1 ) ) ^ 0
3149          * Ct ( Cc "Close" )
3150          * ( EOL + -1 )
3151      end
3152      if arg2 : match "s" then
3153          local right_delim
3154          if arg2 : match "i" then
3155              right_delim = P ( arg5 )
3156          else
3157              right_delim = Q ( arg5 )
3158          end
3159          CommentDelim = CommentDelim +
3160              Ct ( Cc "Open" * Cc ( "{" .. arg3 .. "}" * Cc "}" ) )
3161              * left_delim
3162              * ( MyFun ( ( 1 - P ( arg5 ) - "\r" ) ^ 1 ) + EOL ) ^ 0
3163              * right_delim
3164              * Ct ( Cc "Close" )
3165      end
3166  end
3167 end
3168
3169 local Delim = Q ( S "{[()]}")
3170 local Punct = Q ( S "=,:;!\\"'"')
3171 local Main =

## 11 History

The successive versions of the file `piton.sty` provided by TeXLive are available on the SVN server of TeXLive:

<https://tug.org/svn/texlive/trunk/Master/texmf-dist/tex/lualatex/piton/piton.sty>

The development of the extension `piton` is done on the following GitHub repository:

<https://github.com/fpantigny/piton>

### Changes between versions 3.0 and 3.1

New keys `line-numbers/format`, `detected-beamer-commands` and `detected-beamer-environments`.

## **Changes between versions 2.8 and 3.0**

New command `\NewPitonLanguage`. Thanks to that command, it's now possible to define new informatic languages with the syntax used by `listings`. Therefore, it's possible to say that virtually all the informatic languages are now supported by piton.

## **Changes between versions 2.7 and 2.8**

The key `path` now accepts a *list* of paths where the files to include will be searched.  
New commands `\PitonInputFileT`, `\PitonInputFileF` and `\PitonInputFileTF`.

## **Changes between versions 2.6 and 2.7**

New keys `split-on-empty-lines` and `split-separation`

## **Changes between versions 2.5 and 2.6**

API: `piton.last_code` and `\g_piton_last_code_t1` are provided.

## **Changes between versions 2.4 and 2.5**

New key `path-write`

## **Changes between versions 2.3 and 2.4**

The key `identifiers` of the command `\PitonOptions` is now deprecated and replaced by the new command `\SetPitonIdentifier`.

A new special language called “minimal” has been added.

New key `detected-commands`.

## **Changes between versions 2.2 and 2.3**

New key `detected-commands`

The variable `\l_piton_language_str` is now public.

New key `write`.

## **Changes between versions 2.1 and 2.2**

New key `path` for `\PitonOptions`.

New language SQL.

It's now possible to define styles locally to a given language (with the optional argument of `\SetPitonStyle`).

## **Changes between versions 2.0 and 2.1**

The key `line-numbers` has now subkeys `line-numbers/skip-empty-lines`, `line-numbers/label-empty-lines`, etc.

The key `all-line-numbers` is deprecated: use `line-numbers/skip-empty-lines=false`.

New system to import, with `\PitonInputFile`, only a part (of the file) delimited by textual markers.

New keys `begin-escape`, `end-escape`, `begin-escape-math` and `end-escape-math`.

The key `escape-inside` is deprecated: use `begin-escape` and `end-escape`.

## **Contents**

<b>1      Presentation</b>	<b>1</b>
<b>2      Installation</b>	<b>2</b>

<b>3</b>	<b>Use of the package</b>	<b>2</b>
3.1	Loading the package . . . . .	2
3.2	Choice of the computer language . . . . .	2
3.3	The tools provided to the user . . . . .	2
3.4	The syntax of the command \piton . . . . .	3
<b>4</b>	<b>Customization</b>	<b>4</b>
4.1	The keys of the command \PitonOptions . . . . .	4
4.2	The styles . . . . .	6
4.2.1	Notion of style . . . . .	6
4.2.2	Global styles and local styles . . . . .	7
4.2.3	The style UserFunction . . . . .	8
4.3	Creation of new environments . . . . .	8
<b>5</b>	<b>Definition of new languages with the syntax of listings</b>	<b>9</b>
<b>6</b>	<b>Advanced features</b>	<b>10</b>
6.1	Page breaks and line breaks . . . . .	10
6.1.1	Page breaks . . . . .	10
6.1.2	Line breaks . . . . .	11
6.2	Insertion of a part of a file . . . . .	12
6.2.1	With line numbers . . . . .	12
6.2.2	With textual markers . . . . .	12
6.3	Highlighting some identifiers . . . . .	14
6.4	Mechanisms to escape to LaTeX . . . . .	15
6.4.1	The “LaTeX comments” . . . . .	15
6.4.2	The key “math-comments” . . . . .	16
6.4.3	The key “detected-commands” . . . . .	16
6.4.4	The mechanism “escape” . . . . .	16
6.4.5	The mechanism “escape-math” . . . . .	17
6.5	Behaviour in the class Beamer . . . . .	18
6.5.1	{Piton} et \PitonInputFile are “overlay-aware” . . . . .	18
6.5.2	Commands of Beamer allowed in {Piton} and \PitonInputFile . . . . .	18
6.5.3	Environments of Beamer allowed in {Piton} and \PitonInputFile . . . . .	19
6.6	Footnotes in the environments of piton . . . . .	20
6.7	Tabulations . . . . .	20
<b>7</b>	<b>API for the developpers</b>	<b>20</b>
<b>8</b>	<b>Examples</b>	<b>21</b>
8.1	Line numbering . . . . .	21
8.2	Formatting of the LaTeX comments . . . . .	21
8.3	Notes in the listings . . . . .	22
8.4	An example of tuning of the styles . . . . .	23
8.5	Use with pyluatex . . . . .	24
<b>9</b>	<b>The styles for the different computer languages</b>	<b>25</b>
9.1	The language Python . . . . .	25
9.2	The language OCaml . . . . .	26
9.3	The language C (and C++) . . . . .	27
9.4	The language SQL . . . . .	28
9.5	The language “minimal” . . . . .	29
9.6	The languages defined by \NewPitonLanguage . . . . .	30

<b>10</b>	<b>Implementation</b>	<b>31</b>
10.1	Introduction . . . . .	31
10.2	The L3 part of the implementation . . . . .	32
10.2.1	Declaration of the package . . . . .	32
10.2.2	Parameters and technical definitions . . . . .	35
10.2.3	Treatment of a line of code . . . . .	39
10.2.4	PitonOptions . . . . .	42
10.2.5	The numbers of the lines . . . . .	47
10.2.6	The command to write on the aux file . . . . .	47
10.2.7	The main commands and environments for the final user . . . . .	48
10.2.8	The styles . . . . .	57
10.2.9	The initial styles . . . . .	59
10.2.10	Highlighting some identifiers . . . . .	60
10.2.11	Security . . . . .	61
10.2.12	The error messages of the package . . . . .	62
10.2.13	We load piton.lua . . . . .	64
10.2.14	Detected commands . . . . .	64
10.3	The Lua part of the implementation . . . . .	65
10.3.1	Special functions dealing with LPEG . . . . .	66
10.3.2	The language Python . . . . .	72
10.3.3	The language Ocaml . . . . .	79
10.3.4	The language C . . . . .	84
10.3.5	The language SQL . . . . .	86
10.3.6	The language “Minimal” . . . . .	89
10.3.7	Two variants of the function Parse with integrated preprocessors . . . . .	92
10.3.8	Preprocessors of the function Parse for gobble . . . . .	92
10.3.9	To count the number of lines . . . . .	94
10.3.10	To create new languages with the syntax of listings . . . . .	95
<b>11</b>	<b>History</b>	<b>102</b>
